

**You say it's only constant?**

**Then something must be hyperfinite!**

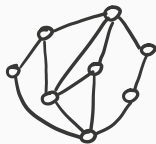

And I say your title is too long.

## $k$ -Disks and Frequency Vectors

$\text{disk}_k(v)$ : subgraph induced  
by BFS( $v$ ) of depth  $k$

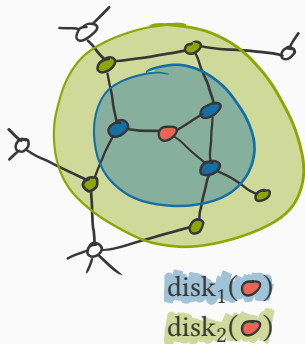

## $k$ -Disks and Frequency Vectors

$\text{disk}_k(v)$ : subgraph induced  
by BFS( $v$ ) of depth  $k$

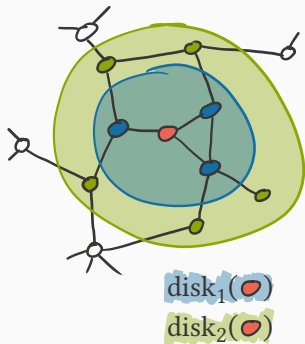

## $k$ -Disks and Frequency Vectors

$\text{disk}_k(v)$ : subgraph induced  
by BFS( $v$ ) of depth  $k$

# $k$ -Disks and Frequency Vectors

$\text{disk}_k(v)$ : subgraph induced by BFS( $v$ ) of depth  $k$

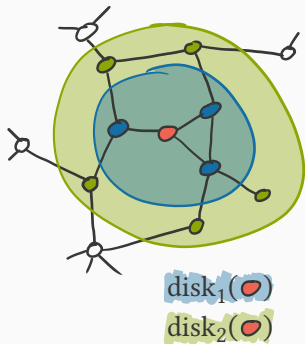

$\text{freq}_k(G)$ : for each  $k$ -disk isomorphism type calculate its share of vertices

$$\text{freq}_2 \left( \begin{array}{c} \text{---} \\ \text{---} \\ \text{---} \end{array} \right) = \frac{\begin{pmatrix} 0.4 \\ 0.6 \\ \vdots \end{pmatrix}}{\sum 1}$$

The diagram shows the frequency vector for  $k=2$ . The vector is  $\begin{pmatrix} 0.4 \\ 0.6 \\ \vdots \end{pmatrix}$ . The component 0.4 is associated with a path of length 2 (two nodes connected by an edge), and the component 0.6 is associated with a triangle (three nodes connected in a cycle). The denominator is  $\sum 1$ .

# $k$ -Disks and Frequency Vectors

$\text{disk}_k(v)$ : subgraph induced by BFS( $v$ ) of depth  $k$

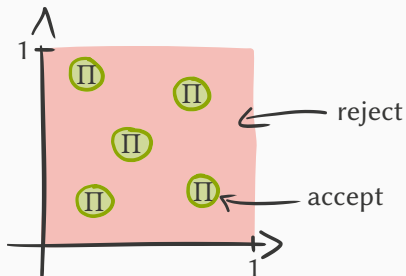

$\text{freq}_k(G)$ : for each  $k$ -disk isomorphism type calculate its share of vertices

$$\text{freq}_2 \left( \begin{array}{c} \text{---} \\ \text{---} \\ \text{---} \end{array} \right) = \frac{\begin{pmatrix} 0.4 \\ 0.6 \\ \vdots \end{pmatrix}}{\sum 1}$$

frequency vector is a  
locality feature

# Constant-Query Testers

## Theorem [GR'09, ...]

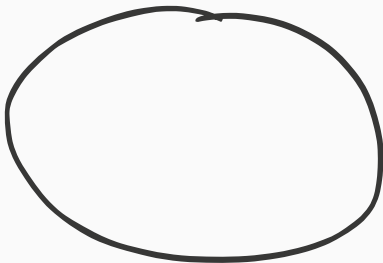

Every property tester with constant query complexity  $q := q(\epsilon)$  can be transformed into an algorithm that

1. computes an approximation  $\widetilde{\text{freq}}_{\Theta(q)}(G)$  of  $\text{freq}_{\Theta(q)}(G)$
2. accepts iff  $\|\widetilde{\text{freq}}_{\Theta(q)}(G) - \text{freq}_{\Theta(q)}(G')\|_1 \leq \frac{1}{\Theta(q)}$  for any  $G' \in \Pi$
