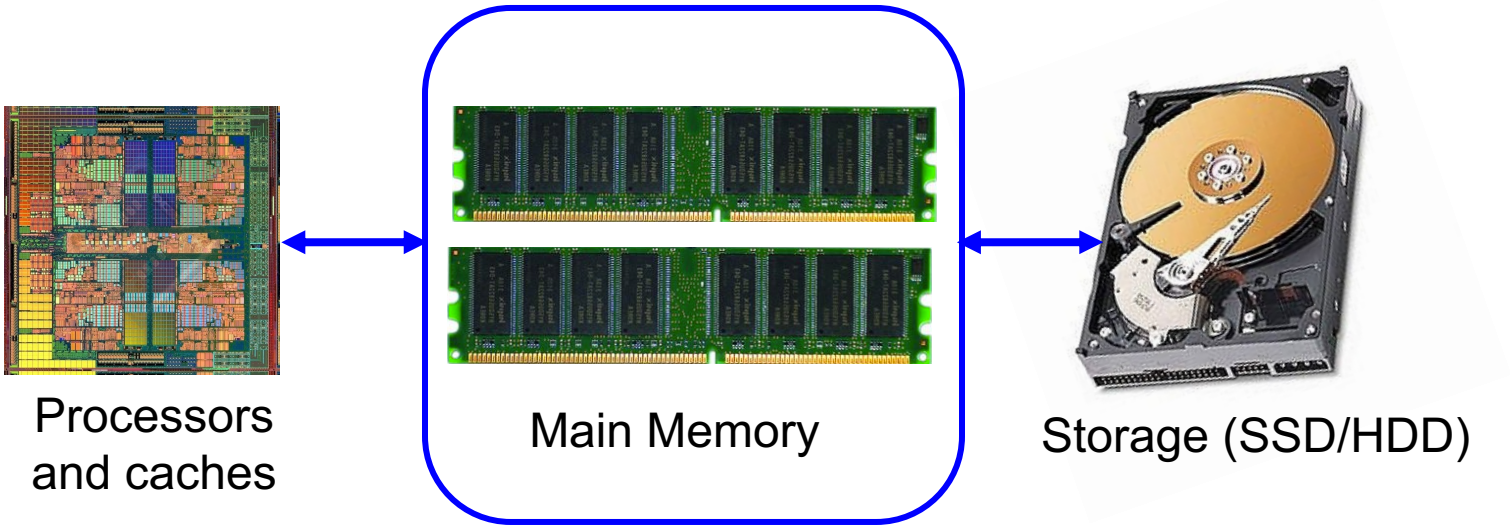
APPT Keynote

SAFARI ETH zürich Carnegie Mellon

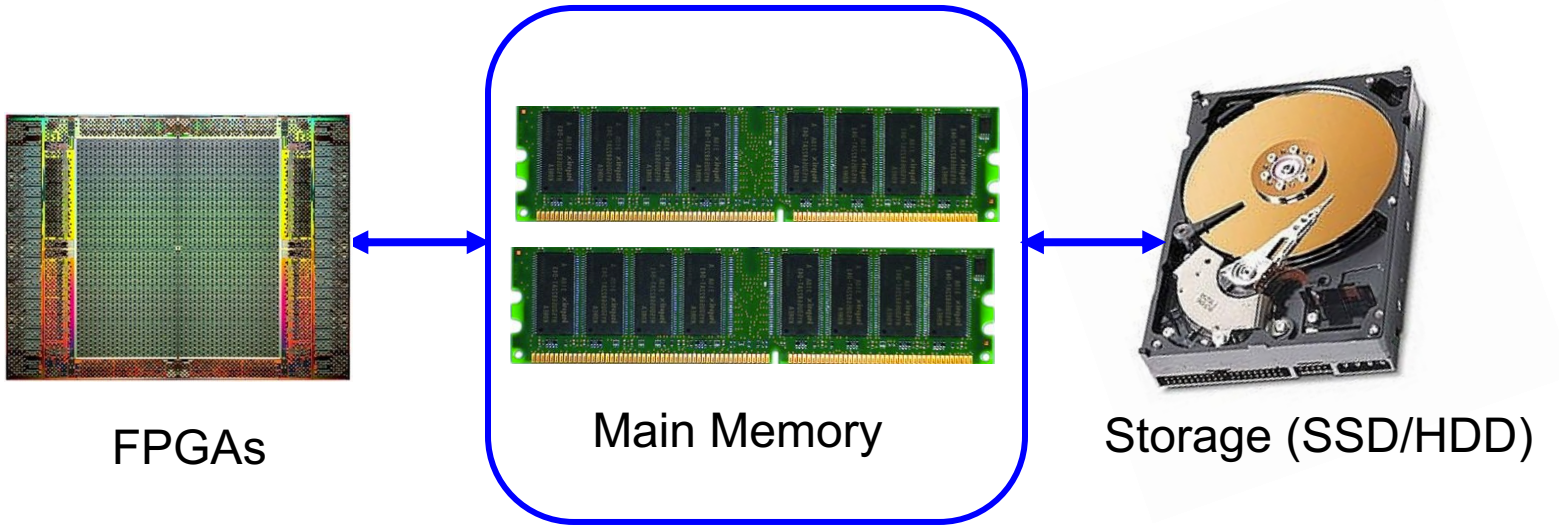
The Main Memory System



- Main memory is a critical component of all computing systems: server, mobile, embedded, desktop, sensor

- Main memory system must scale (in *size*, *technology*, *efficiency*, *cost*, and *management algorithms*) to maintain performance growth and technology scaling benefits

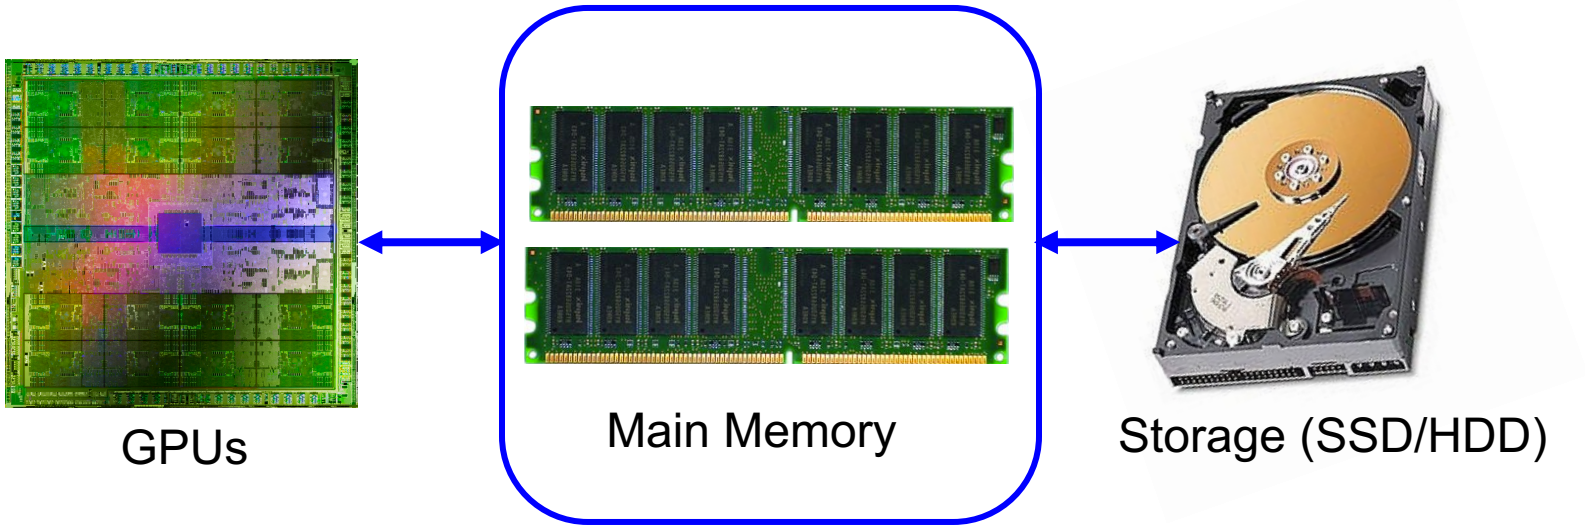
The Main Memory System



- Main memory is a critical component of all computing systems: server, mobile, embedded, desktop, sensor

- Main memory system must scale (in *size*, *technology*, *efficiency*, *cost*, and *management algorithms*) to maintain performance growth and technology scaling benefits

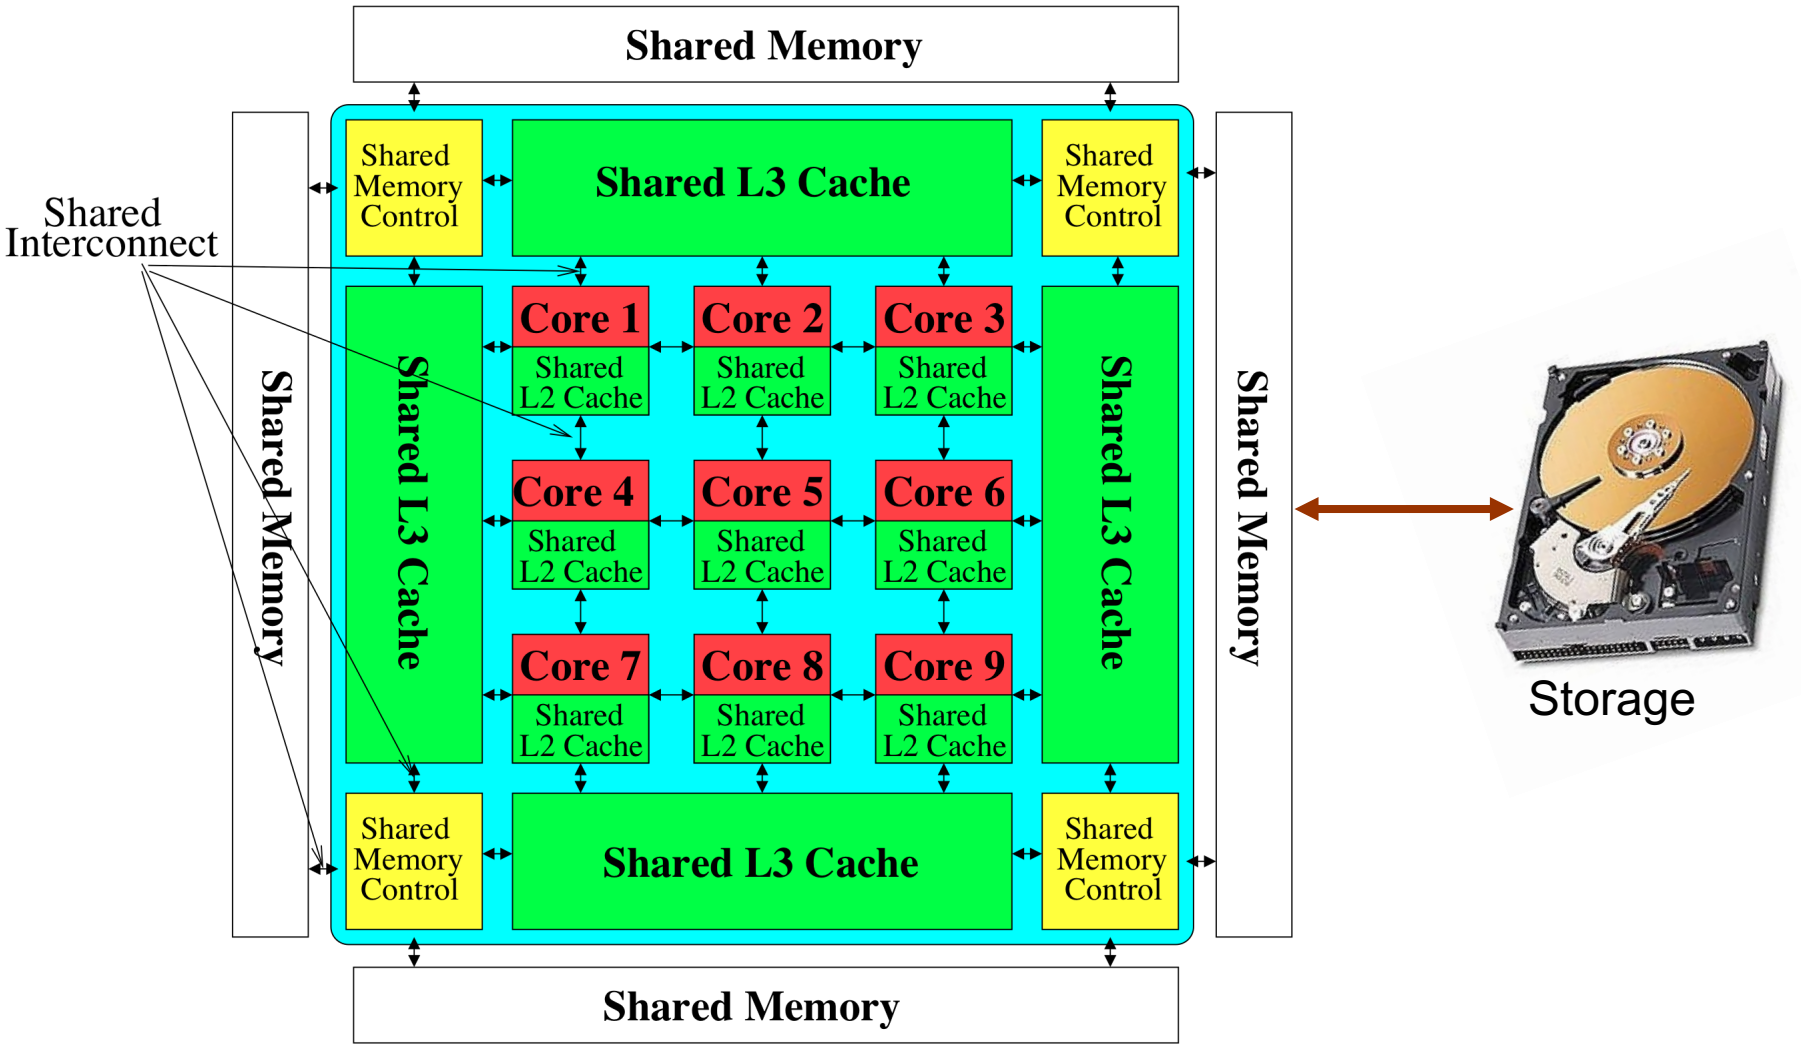
The Main Memory System



- Main memory is a critical component of all computing systems: server, mobile, embedded, desktop, sensor

- Main memory system must scale (in *size*, *technology*, *efficiency*, *cost*, and *management algorithms*) to maintain performance growth and technology scaling benefits

Memory System: A *Shared Resource* View



Most of the system is dedicated to storing and moving data

State of the Main Memory System

- Recent technology, architecture, and application trends
  - lead to new requirements
  - exacerbate old requirements

- DRAM and memory controllers, as we know them today, are (will be) unlikely to satisfy all requirements

- Some emerging non-volatile memory technologies (e.g., PCM) enable new opportunities: memory+storage merging

- We need to rethink the main memory system
  - to fix DRAM issues and enable emerging technologies
  - to satisfy all requirements

Major Trends Affecting Main Memory (I)

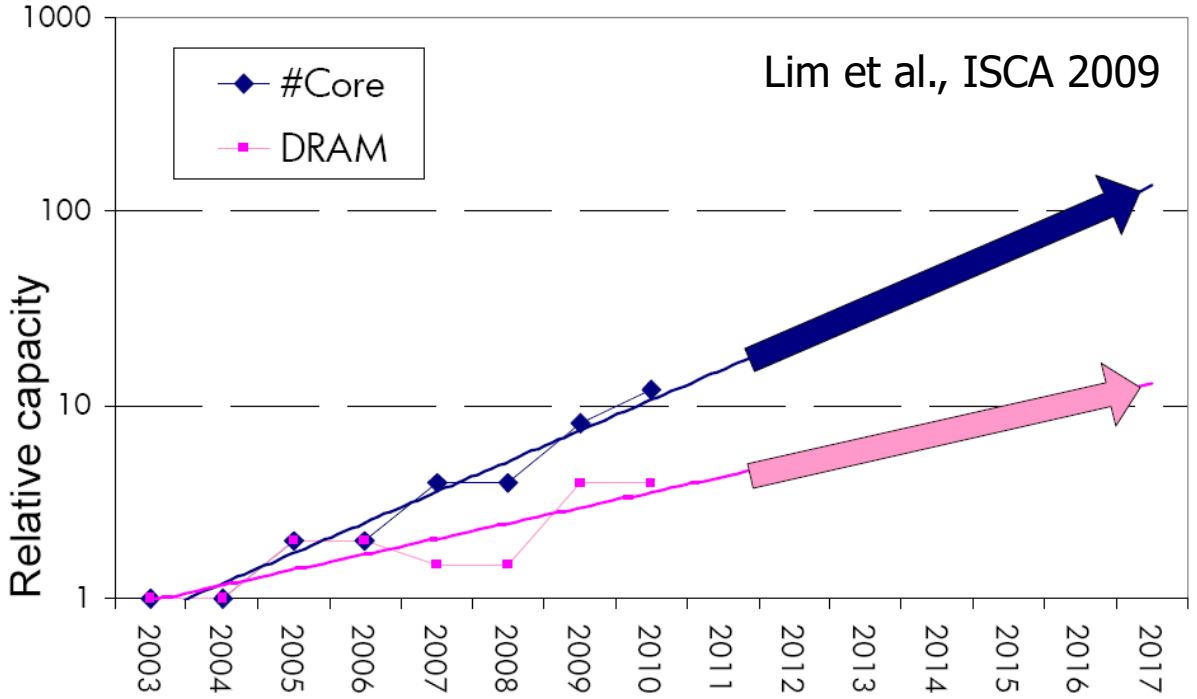
- Need for main memory capacity, bandwidth, QoS increasing
- Main memory energy/power is a key system design concern
- DRAM technology scaling is ending

Major Trends Affecting Main Memory (II)

- Need for main memory capacity, bandwidth, QoS increasing
  - Multi-core: increasing number of cores/agents
  - Data-intensive applications: increasing demand/hunger for data
  - Consolidation: cloud computing, GPUs, mobile, heterogeneity
- Main memory energy/power is a key system design concern
- DRAM technology scaling is ending

Example: The Memory Capacity Gap

Core count doubling ~ every 2 years
DRAM DIMM capacity doubling ~ every 3 years



- *Memory capacity per core* expected to drop by 30% every two years
- Trends worse for *memory bandwidth per core*!

DRAM Capacity, Bandwidth & Latency

Major Trends Affecting Main Memory (III)

- Need for main memory capacity, bandwidth, QoS increasing

- Main memory energy/power is a key system design concern
  - ~40-50% energy spent in off-chip memory hierarchy [Lefurgy, IEEE Computer'03] >40% power in DRAM [Ware, HPCA'10][Paul,ISCA'15]
  - DRAM consumes power even when not used (periodic refresh)

- DRAM technology scaling is ending

Energy Waste in Mobile Devices

Major Trends Affecting Main Memory (IV)

- Need for main memory capacity, bandwidth, QoS increasing

- Main memory energy/power is a key system design concern

- DRAM technology scaling is ending
  - ITRS projects DRAM will not scale easily below X nm
  - Scaling has provided many benefits:
    - higher capacity (density), lower cost, lower energy

Major Trends Affecting Main Memory (V)

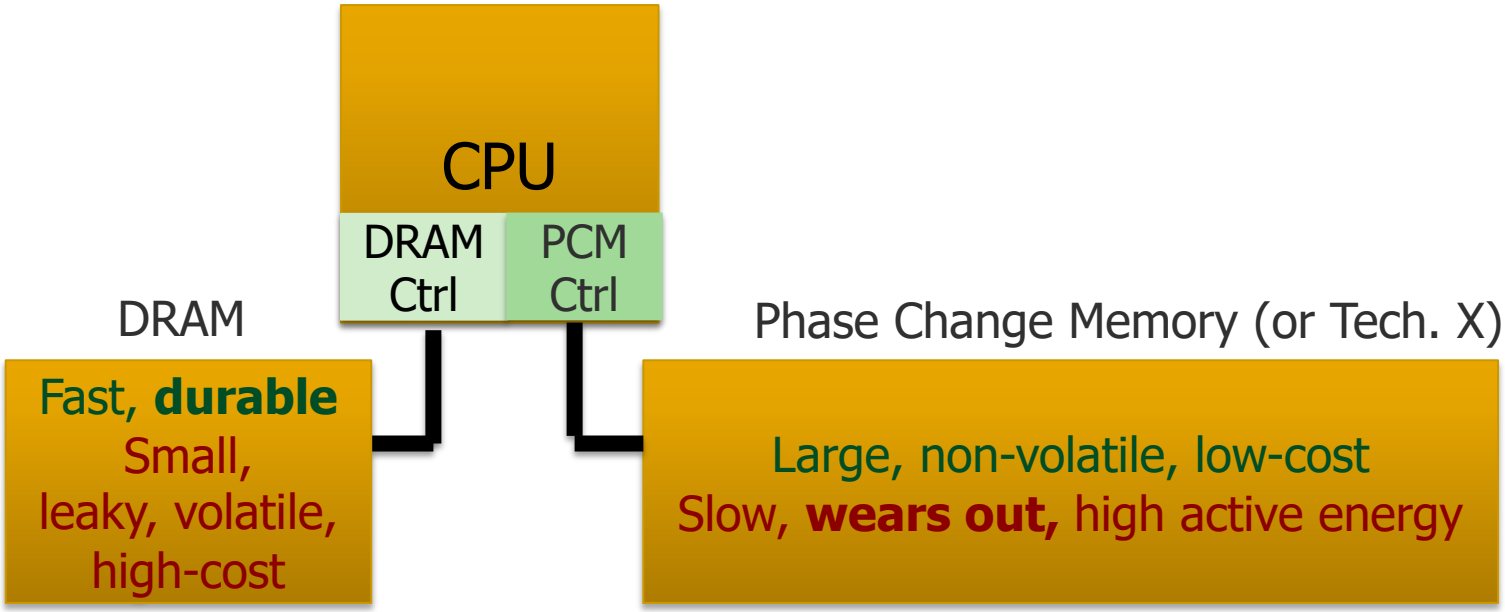
- DRAM scaling has already become increasingly difficult
  - Increasing cell leakage current, reduced cell reliability, increasing manufacturing difficulties [Kim+ ISCA 2014], [Liu+ ISCA 2013], [Mutlu IMW 2013], [Mutlu DATE 2017]
  - **Difficult to significantly improve capacity, energy**
- **Emerging memory technologies** are promising

Major Trends Affecting Main Memory (V)

- DRAM scaling has already become increasingly difficult
  - Increasing cell leakage current, reduced cell reliability, increasing manufacturing difficulties [Kim+ ISCA 2014], [Liu+ ISCA 2013], [Mutlu IMW 2013], [Mutlu DATE 2017]
  - **Difficult to significantly improve capacity, energy**
- **Emerging memory technologies** are promising

3D-Stacked DRAM	higher bandwidth	smaller capacity
Reduced-Latency DRAM (e.g., RL/TL-DRAM, FLY-RAM)	lower latency	higher cost
Low-Power DRAM (e.g., LPDDR3, LPDDR4, Voltron)	lower power	higher latency higher cost
Non-Volatile Memory (NVM) (e.g., PCM, STTRAM, ReRAM, 3D Xpoint)	larger capacity	higher latency higher dynamic power lower endurance

Major Trend: Hybrid Main Memory



Hardware/software manage data allocation and movement
to achieve the best of multiple technologies

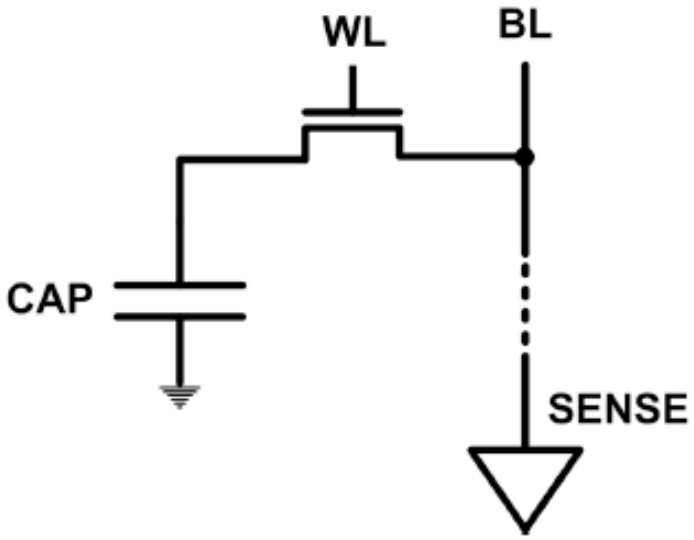
The DRAM Scaling Problem

- DRAM stores charge in a capacitor (charge-based memory)
  - Capacitor must be large enough for reliable sensing
  - Access transistor should be large enough for low leakage and high retention time
  - Scaling beyond 40-35nm (2013) is challenging [ITRS, 2009]



- DRAM capacity, cost, and energy/power hard to scale

As Memory Scales, It Becomes Unreliable

Exploiting the DRAM rowhammer bug to gain kernel privileges

RowHammer Security Attack Example

- "Rowhammer" is a problem with some recent DRAM devices in which repeatedly accessing a row of memory can cause bit flips in adjacent rows (Kim et al., ISCA 2014).
  - Flipping Bits in Memory Without Accessing Them: An Experimental Study of DRAM Disturbance Errors (Kim et al., ISCA 2014)
- We tested a selection of laptops and found that a subset of them exhibited the problem.
- We built two working privilege escalation exploits that use this effect.
  - Exploiting the DRAM rowhammer bug to gain kernel privileges (Seaborn+, 2015)
- One exploit uses rowhammer-induced bit flips to gain kernel privileges on x86-64 Linux when run as an unprivileged userland process.
- When run on a machine vulnerable to the rowhammer problem, the process was able to induce bit flips in page table entries (PTEs).
- It was able to use this to gain write access to its own page table, and hence gain read-write access to all of physical memory.

More Security Implications?

Apple's Patch for RowHammer

- https://support.apple.com/en-gb/HT204934

Available for: OS X Mountain Lion v10.8.5, OS X Mavericks v10.9.5

Impact: A malicious application may induce memory corruption to escalate privileges

Description: A disturbance error, also known as Rowhammer, exists with some DDR3 RAM that could have led to memory corruption. This issue was mitigated by increasing memory refresh rates.

CVE-ID

CVE-2015-3693 : Mark Seaborn and Thomas Dullien of Google, working from original research by Yoongu Kim et al (2014)

HP, Lenovo, and other vendors released similar patches

Our Solution to RowHammer

- PARA: *Probabilistic Adjacent Row Activation*
- Key Idea
  - After closing a row, we activate (i.e., refresh) one of its neighbors with a low probability: $p = 0.005$
- Reliability Guarantee
  - When $p=0.005$, errors in one year: 9.4×10^{-14}
  - By adjusting the value of p, we can vary the strength of protection against errors

Advantages of PARA

- *PARA refreshes rows infrequently*
  - Low power
  - Low performance-overhead
    - Average slowdown: 0.20% (for 29 benchmarks)
    - Maximum slowdown: 0.75%
- *PARA is stateless*
  - Low cost
  - Low complexity

- *PARA is an effective and low-overhead solution to prevent disturbance errors*

Requirements for PARA

- If implemented in DRAM chip (done today)
  - Enough slack in timing and refresh parameters
  - Plenty of slack today:
    - Lee et al., "Adaptive-Latency DRAM: Optimizing DRAM Timing for the Common Case," HPCA 2015.
    - Chang et al., "Understanding Latency Variation in Modern DRAM Chips," SIGMETRICS 2016.
    - Lee et al., "Design-Induced Latency Variation in Modern DRAM Chips," SIGMETRICS 2017.
    - Chang et al., "Understanding Reduced-Voltage Operation in Modern DRAM Devices," SIGMETRICS 2017.
    - Ghose et al., "What Your DRAM Power Models Are Not Telling You: Lessons from a Detailed Experimental Study," SIGMETRICS 2018.

- If implemented in memory controller
  - Better coordination between memory controller and DRAM
  - Memory controller should know which rows are physically adjacent

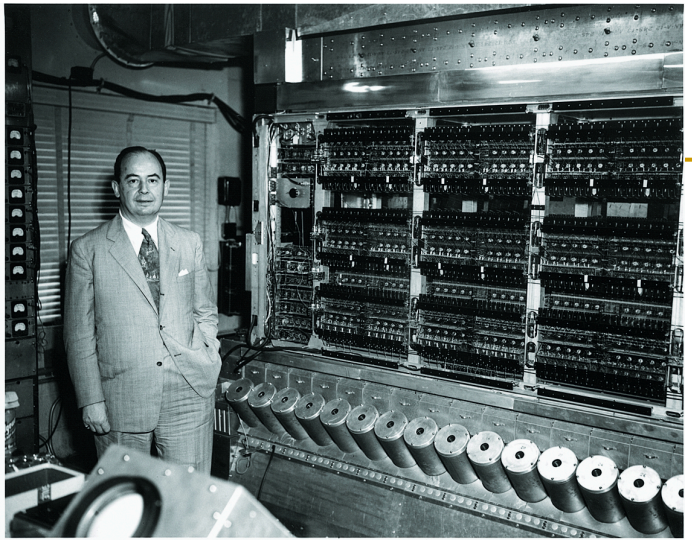
A Computing System

- Three key components
- Computation
- Communication
- Storage/memory



Burks, Goldstein, von Neumann, "Preliminary discussion of the logical design of an electronic computing instrument," 1946.

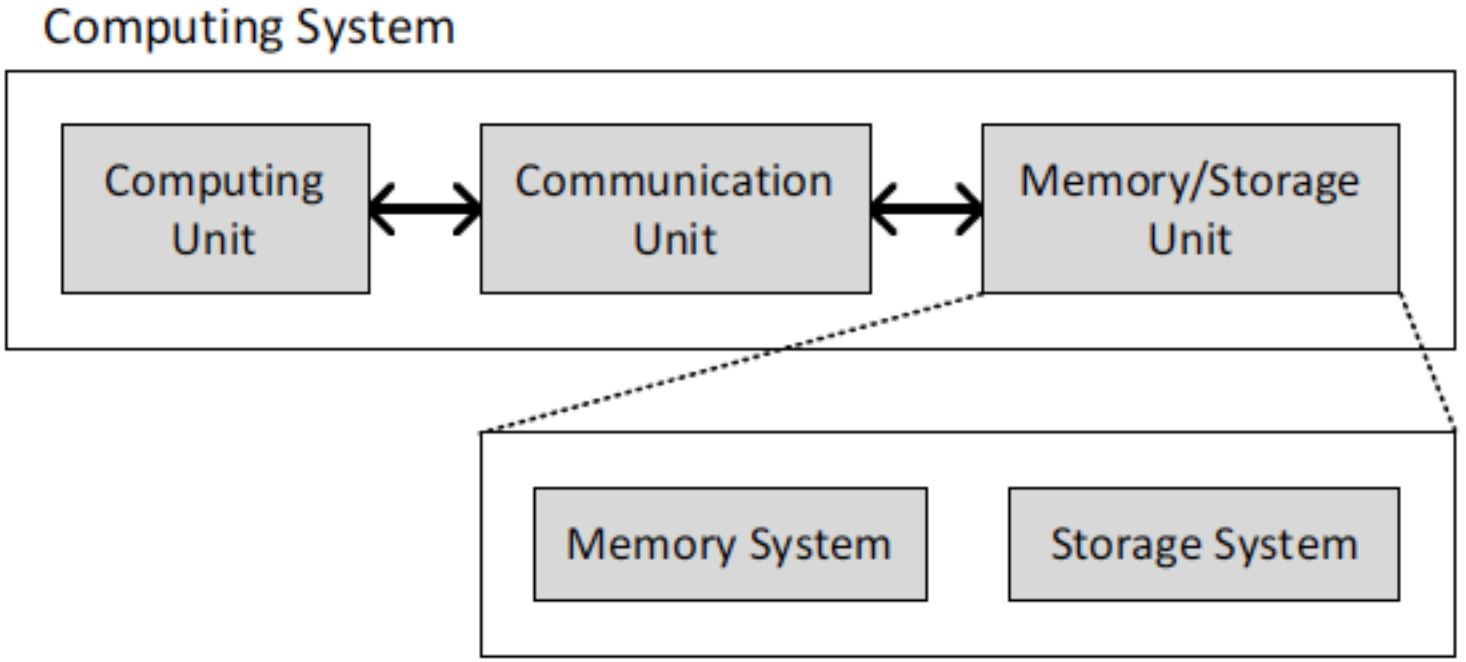


Image source: https://lbsitbytes2010.wordpress.com/2013/03/29/john-von-neumann-roll-no-15/

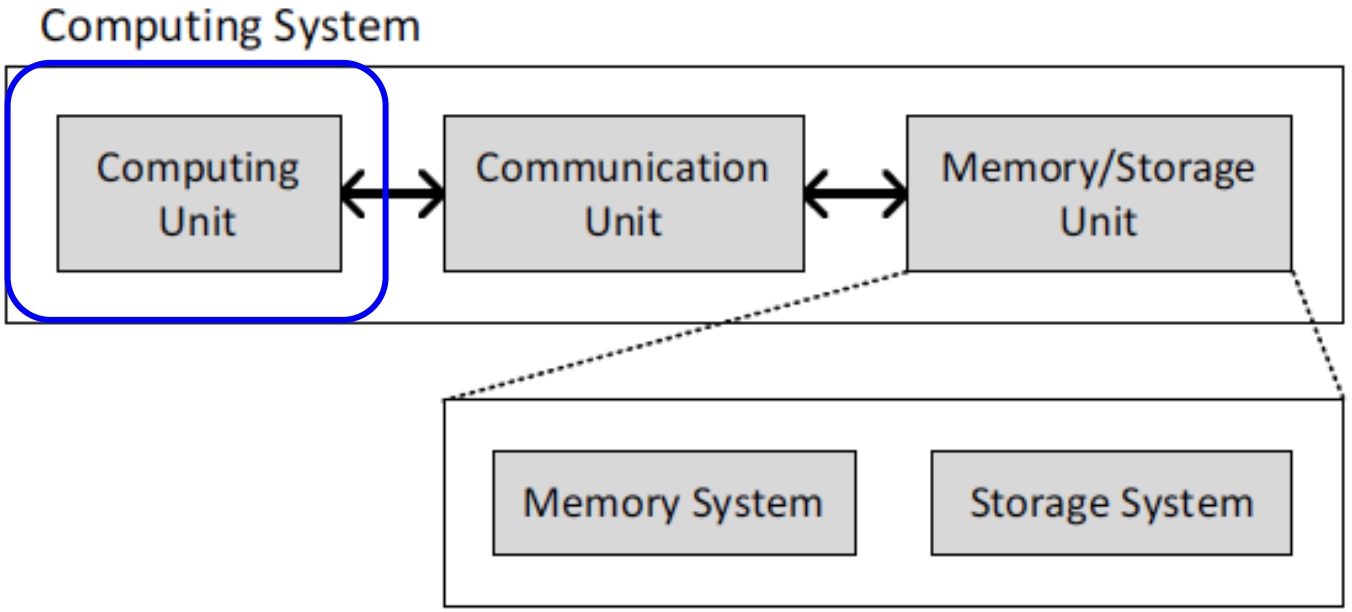
Today's Computing Systems

- Are overwhelmingly processor centric
- All data processed in the processor → at great system cost
- Processor is heavily optimized and is considered the master
- Data storage units are dumb and are largely unoptimized (except for some that are on the processor die)



Yet …

- "**It's the Memory, Stupid!**" (Richard Sites, MPR, 1996)

Perils of Processor-Centric Design

- Grossly-imbalanced systems
  - Processing done only in **one place**
  - Everything else just stores and moves data: **data moves a lot**

  → Energy inefficient

  → Low performance

  → Complex

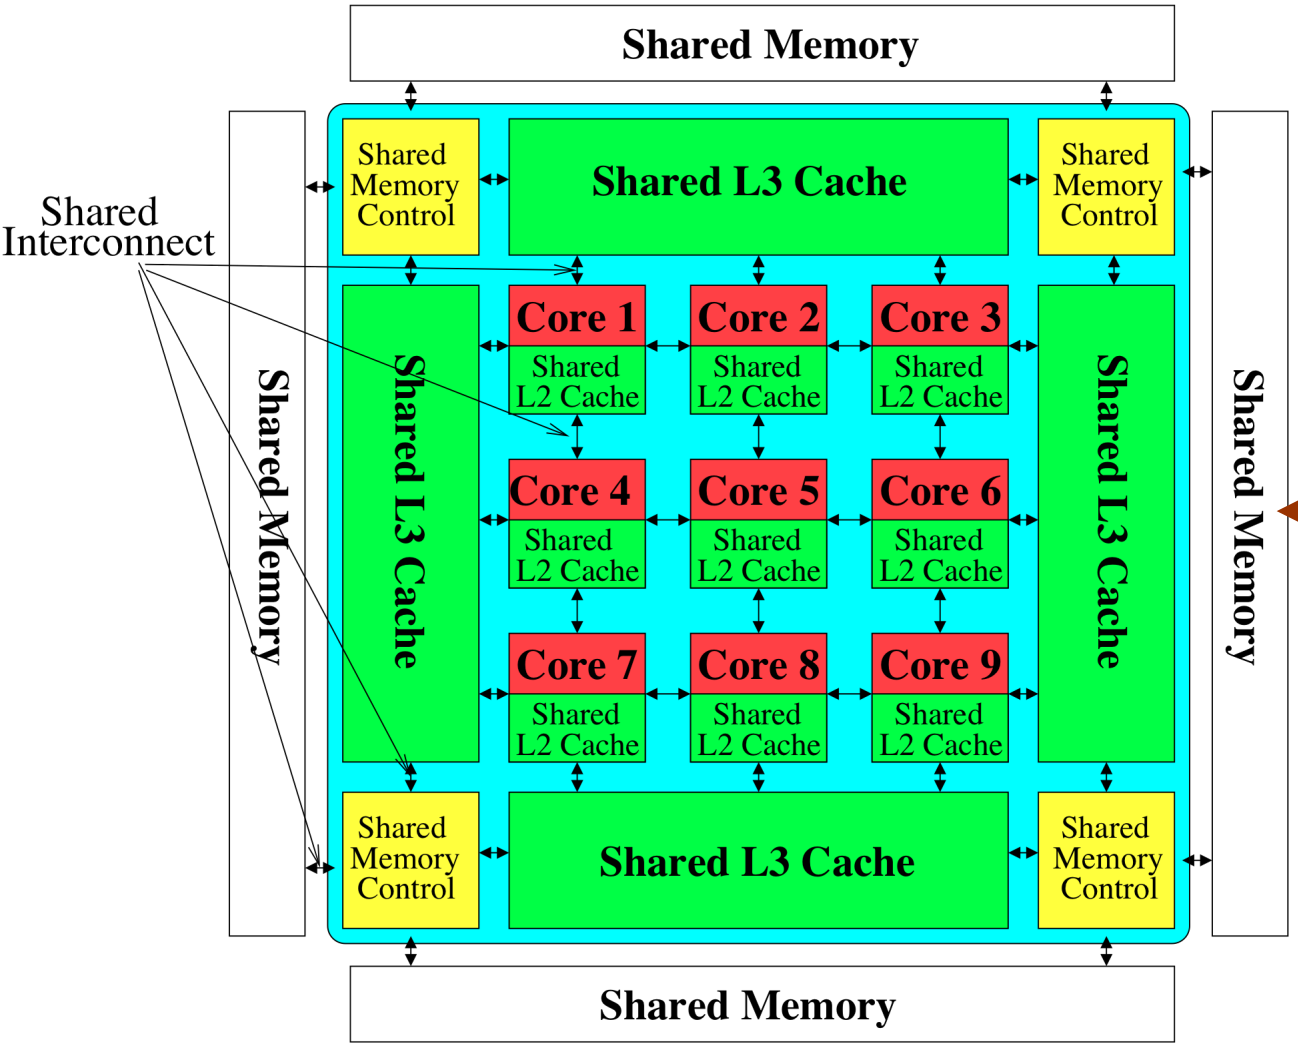
- Overly complex and bloated processor (and accelerators)
  - To tolerate data access from memory
  - Complex hierarchies and mechanisms

  → Energy inefficient

  → Low performance

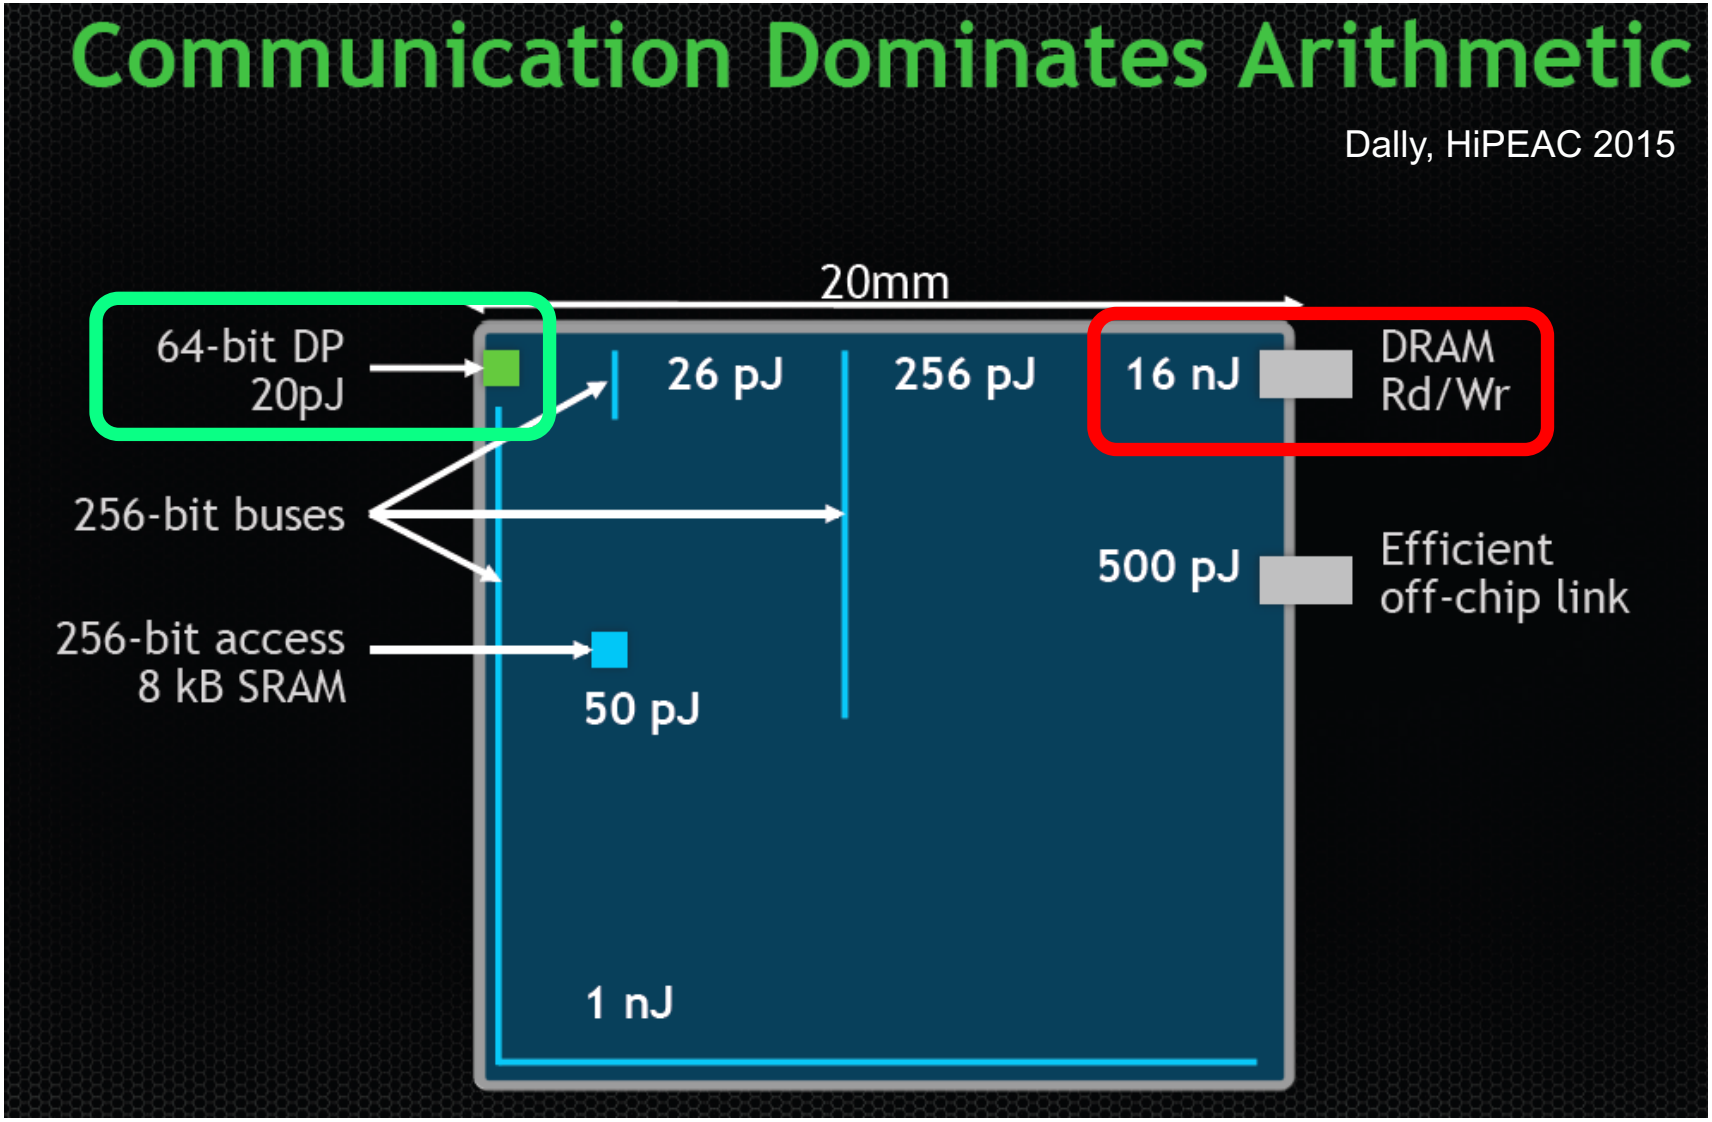
  → Complex

Perils of Processor-Centric Design

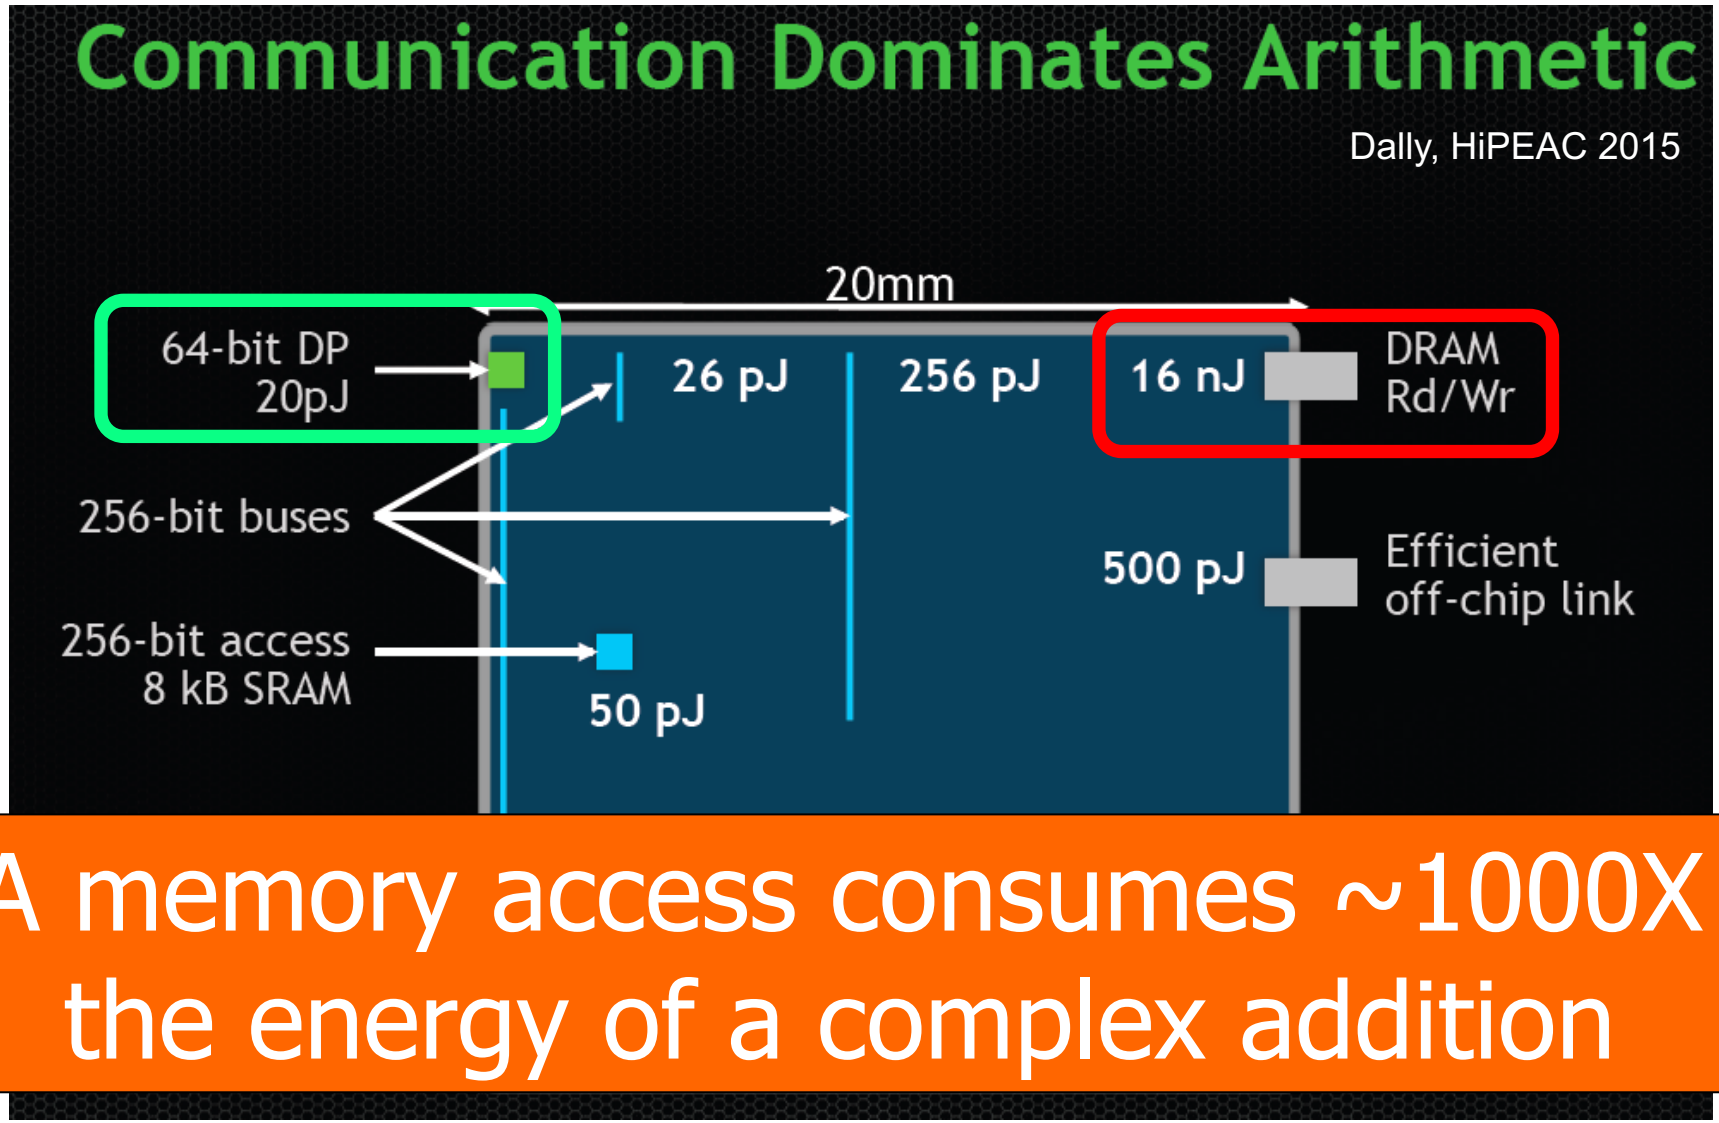


Most of the system is dedicated to storing and moving data

The Energy Perspective



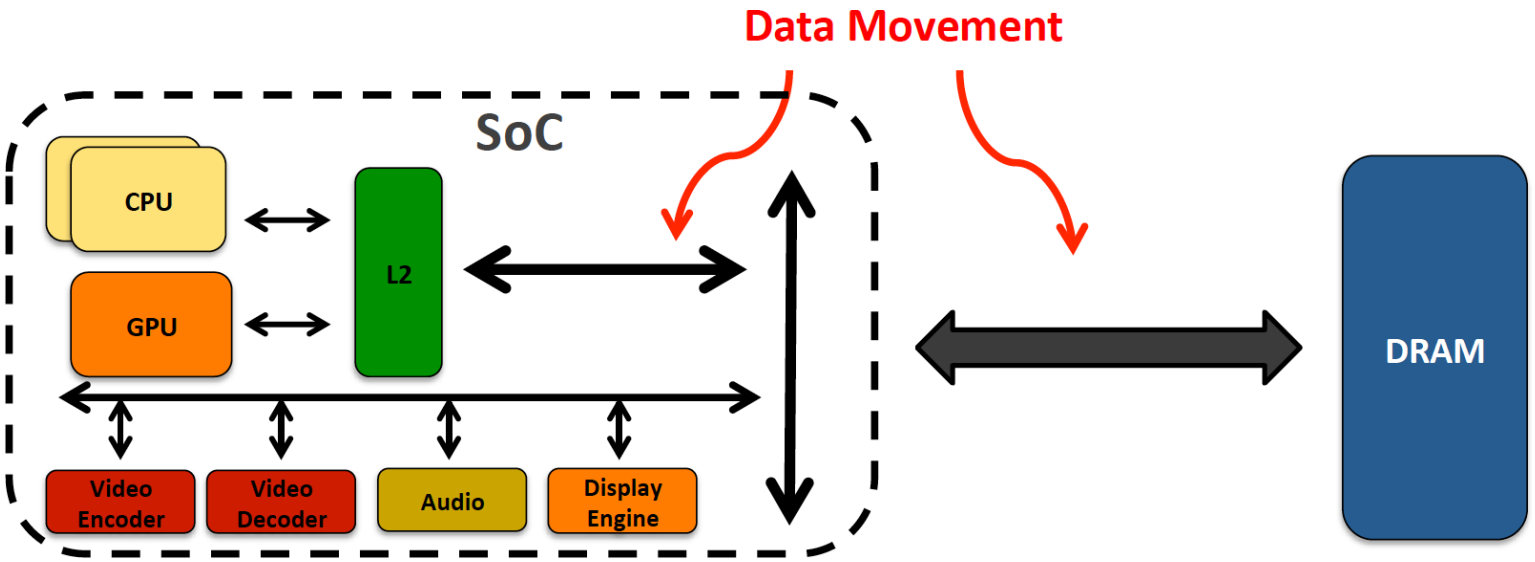
Data Movement vs. Computation Energy



A memory access consumes ~1000X the energy of a complex addition

Data Movement vs. Computation Energy

- Data movement is a major system energy bottleneck
  - Comprises 41% of mobile system energy during web browsing [2]
  - Costs ~115 times as much energy as an ADD operation [1, 2]



[1]: Reducing data Movement Energy via Online Data Clustering and Encoding (MICRO'16)

[2]: Quantifying the energy cost of data movement for emerging smart phone workloads on mobile platforms (IISWC'14)

Energy Waste in Mobile Devices

- Amirali Boroumand, Saugata Ghose, Youngsok Kim, Rachata Ausavarungnirun, Eric Shiu, Rahul Thakur, Daehyun Kim, Aki Kuusela, Allan Knies, Parthasarathy Ranganathan, and Onur Mutlu, **"Google Workloads for Consumer Devices: Mitigating Data Movement Bottlenecks"** *Proceedings of the 23rd International Conference on Architectural Support for Programming Languages and Operating Systems (**ASPLOS**)*, Williamsburg, VA, USA, March 2018.

62.7% of the total system energy is spent on data movement

Google Workloads for Consumer Devices: Mitigating Data Movement Bottlenecks

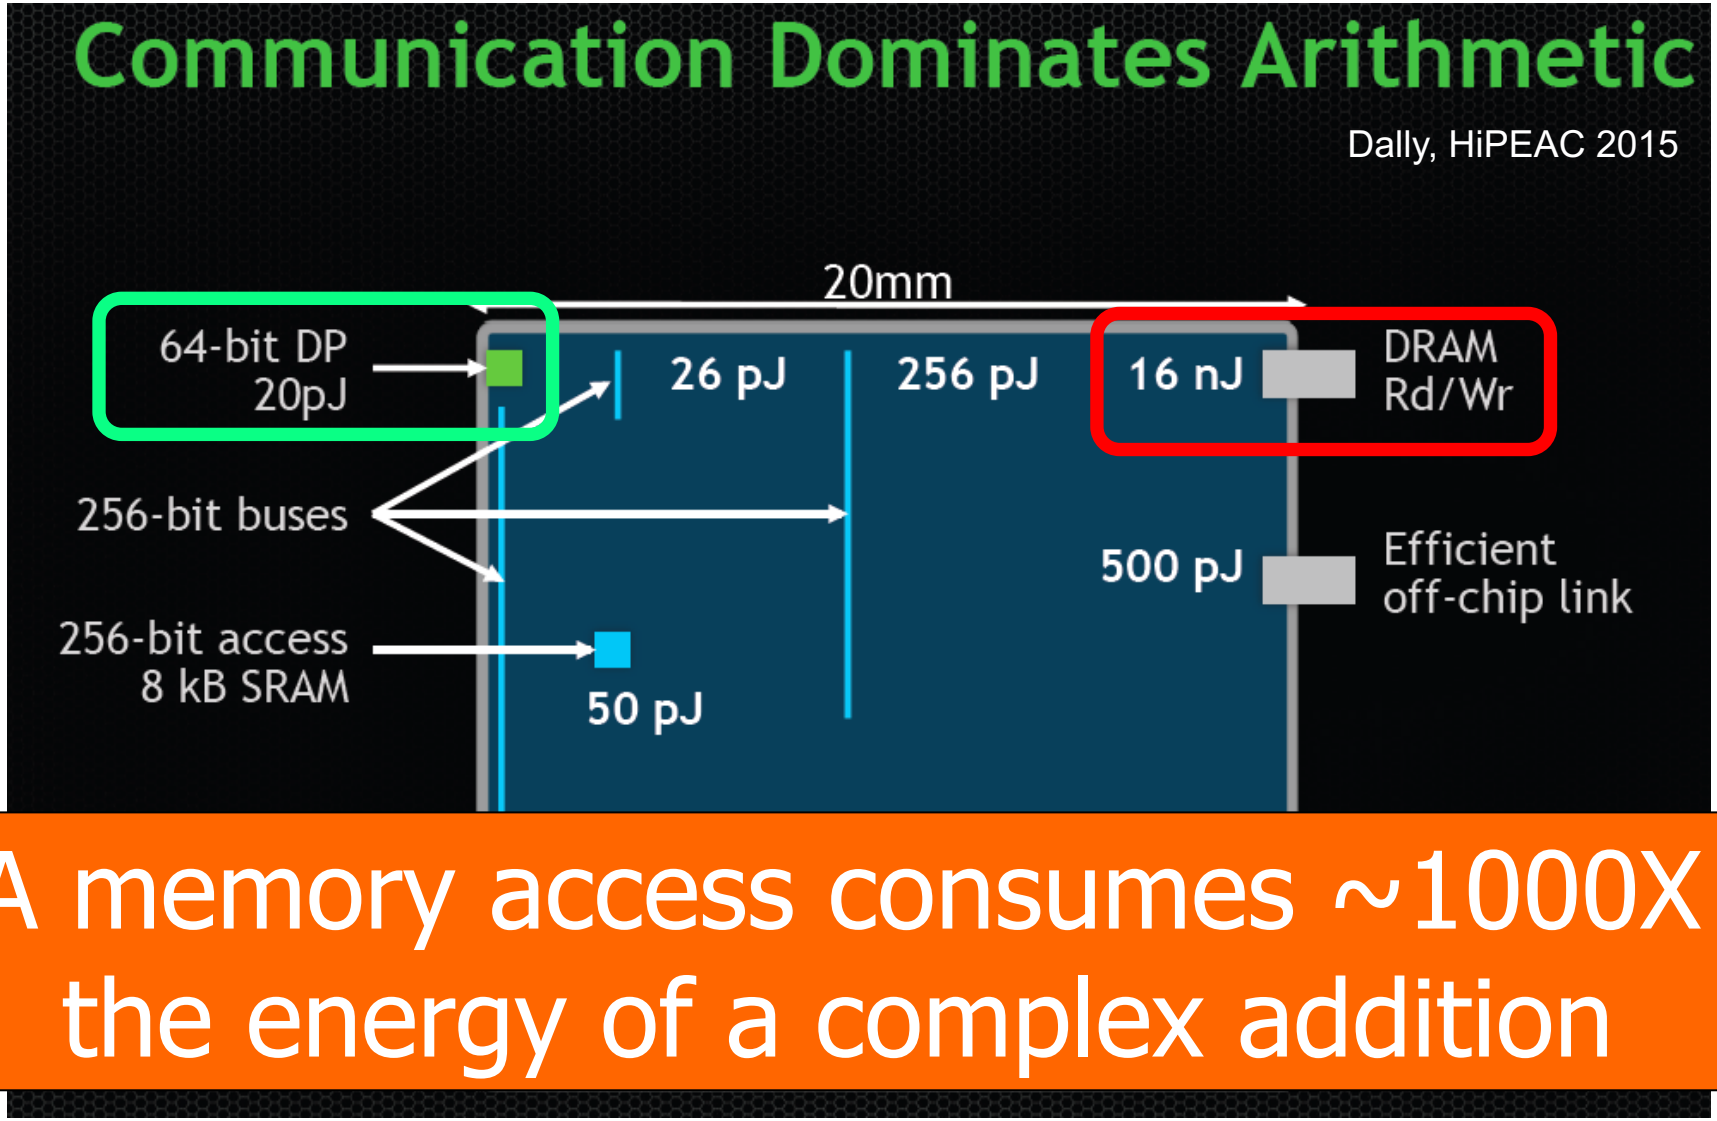
Aki Kuusela[3] Allan Knies[3] Parthasarathy Ranganathan[3] Onur Mutlu[5,1]

We Do Not Want to Move Data!

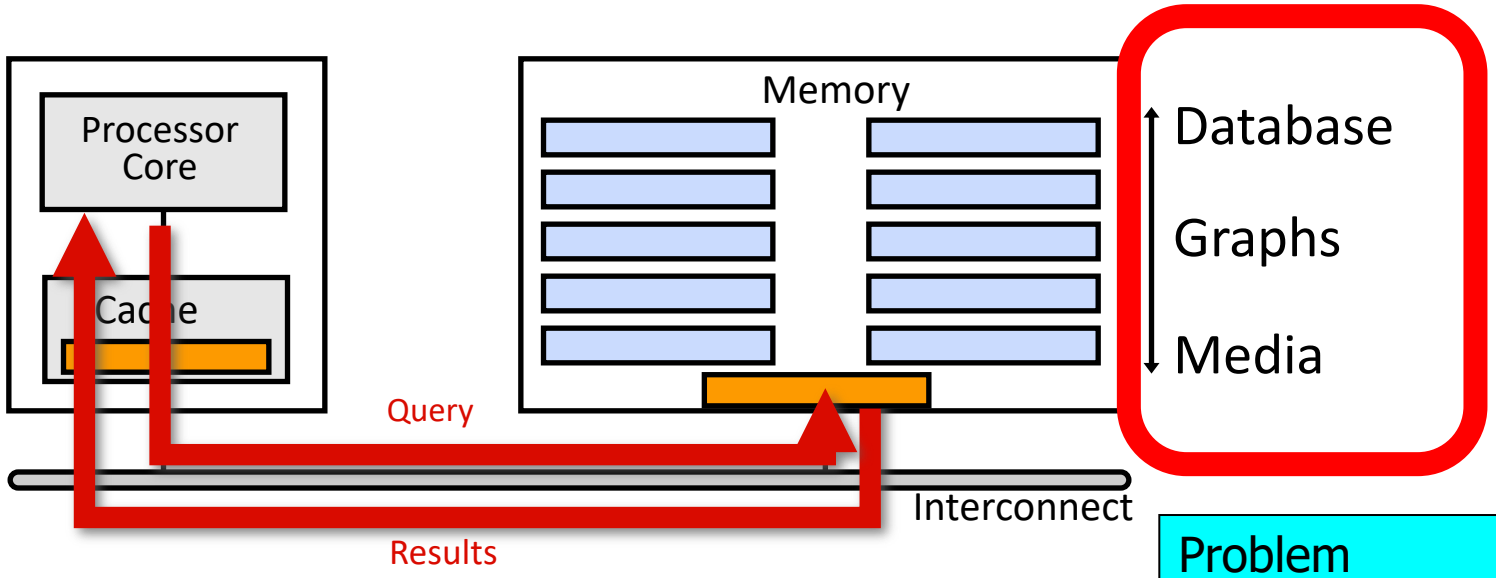


A memory access consumes ~1000X the energy of a complex addition

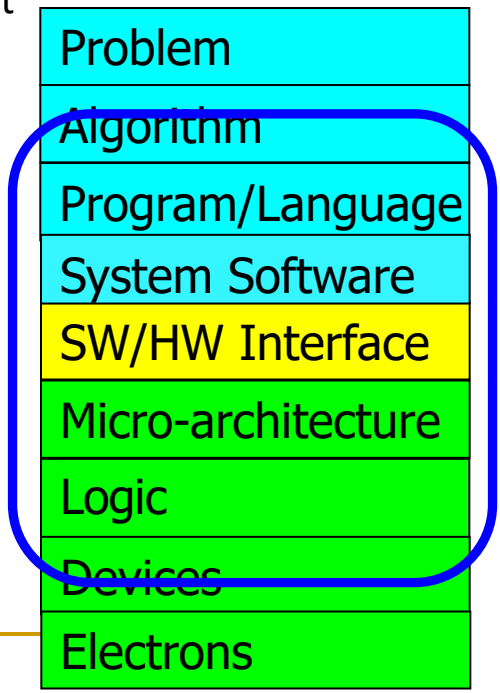
We Need A Paradigm Shift To …

- Enable computation with minimal data movement
- Compute where it makes sense (where data resides)
- Make computing architectures more data-centric

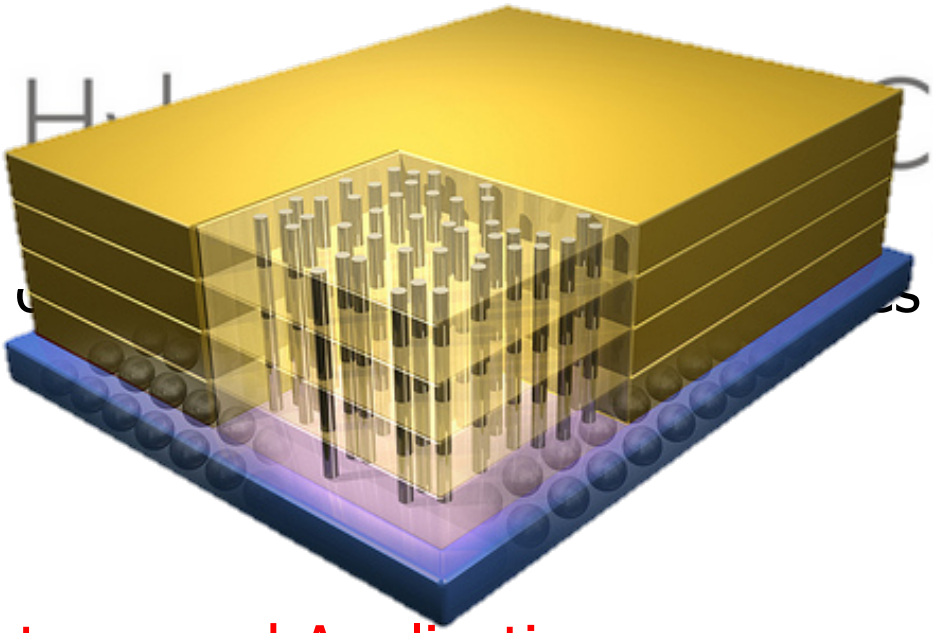
Goal: Processing Inside Memory



- Many questions … How do we design the:
  - compute-capable memory & controllers?
  - processor chip and in-memory units?
  - software and hardware interfaces?
  - system software and languages?
  - algorithms?



Why In-Memory Computation Today?



Dally, HiPEAC 2

- Pull from Systems and Applications
  - Data access is a major system and application bottleneck
  - Systems are energy limited
  - Data movement much more energy-hungry than computation

Agenda

- Major Trends Affecting Main Memory
- The Need for Intelligent Memory Controllers
  - Bottom Up: Push from Circuits and Devices
  - Top Down: Pull from Systems and Applications
- Processing in Memory: Two Directions
  - Minimally Changing Memory Chips
  - Exploiting 3D-Stacked Memory
- How to Enable Adoption of Processing in Memory
- Conclusion

Processing in Memory: Two Approaches

1. Minimally changing memory chips
2. Exploiting 3D-stacked memory

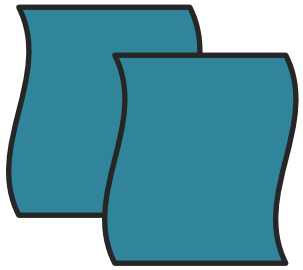
Approach 1: Minimally Changing DRAM

- DRAM has great capability to perform bulk data movement and computation internally with small changes
  - Can exploit internal connectivity to move data
  - Can exploit analog computation capability
  - …

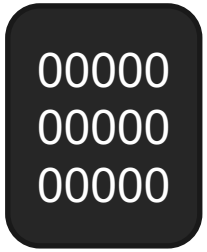
- Examples: RowClone, In-DRAM AND/OR, Gather/Scatter DRAM
  - RowClone: Fast and Efficient In-DRAM Copy and Initialization of Bulk Data (Seshadri et al., MICRO 2013)
  - Fast Bulk Bitwise AND and OR in DRAM (Seshadri et al., IEEE CAL 2015)
  - Gather-Scatter DRAM: In-DRAM Address Translation to Improve the Spatial Locality of Non-unit Strided Accesses (Seshadri et al., MICRO 2015)
  - "Ambit: In-Memory Accelerator for Bulk Bitwise Operations Using Commodity DRAM Technology" (Seshadri et al., MICRO 2017)

Starting Simple: Data Copy and Initialization

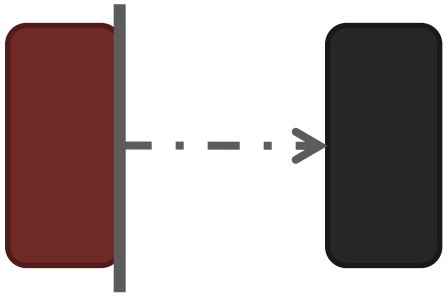
memmove & memcpy: 5% cycles in Google's datacenter [Kanev+ ISCA'15]



Forking

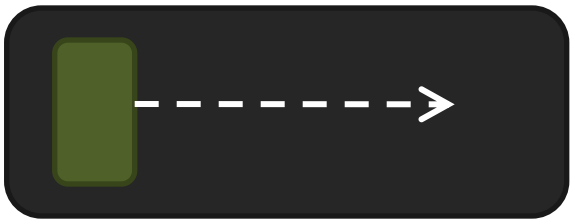


Zero initialization (e.g., security)



Checkpointing

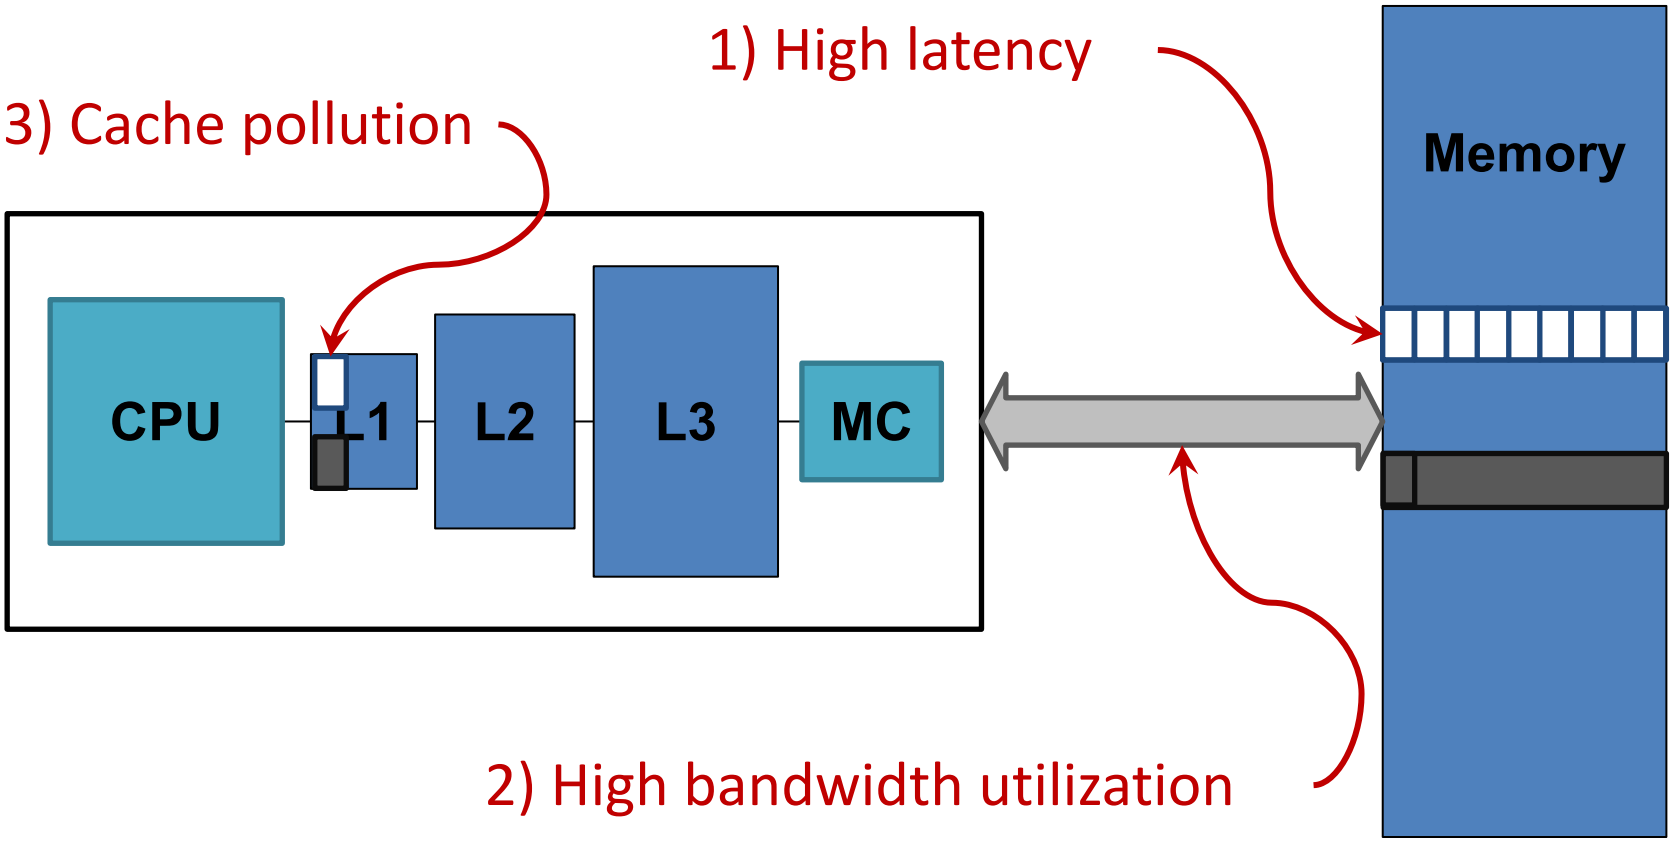
VM Cloning
Deduplication



Page Migration

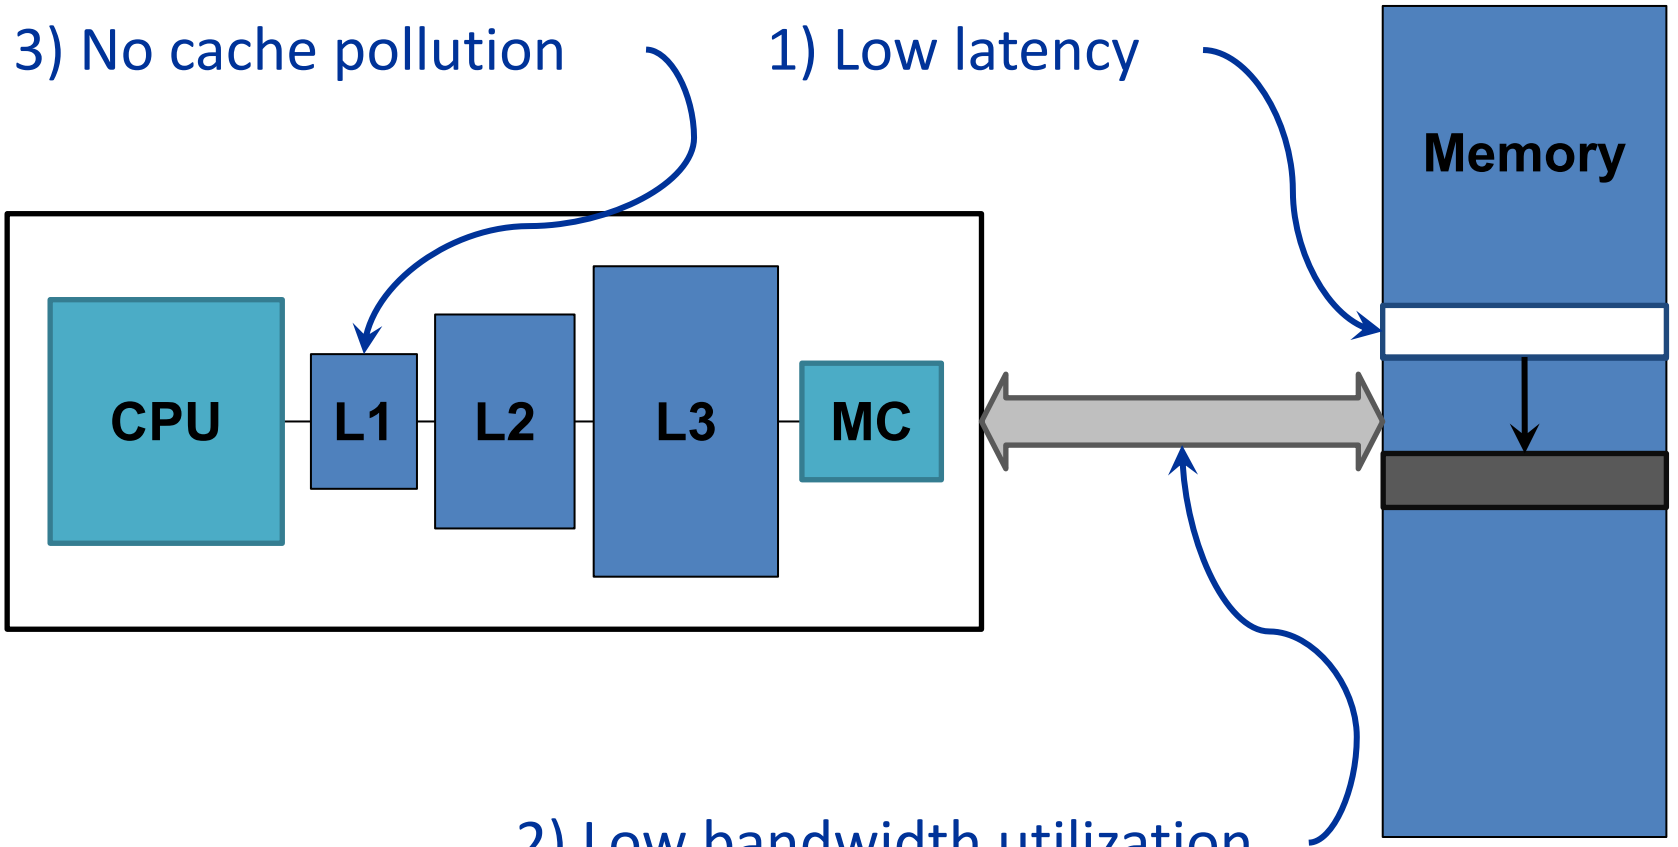
• • •
Many more

Today's Systems: Bulk Data Copy



1046ns, 3.6uJ (for 4KB page copy via DMA)

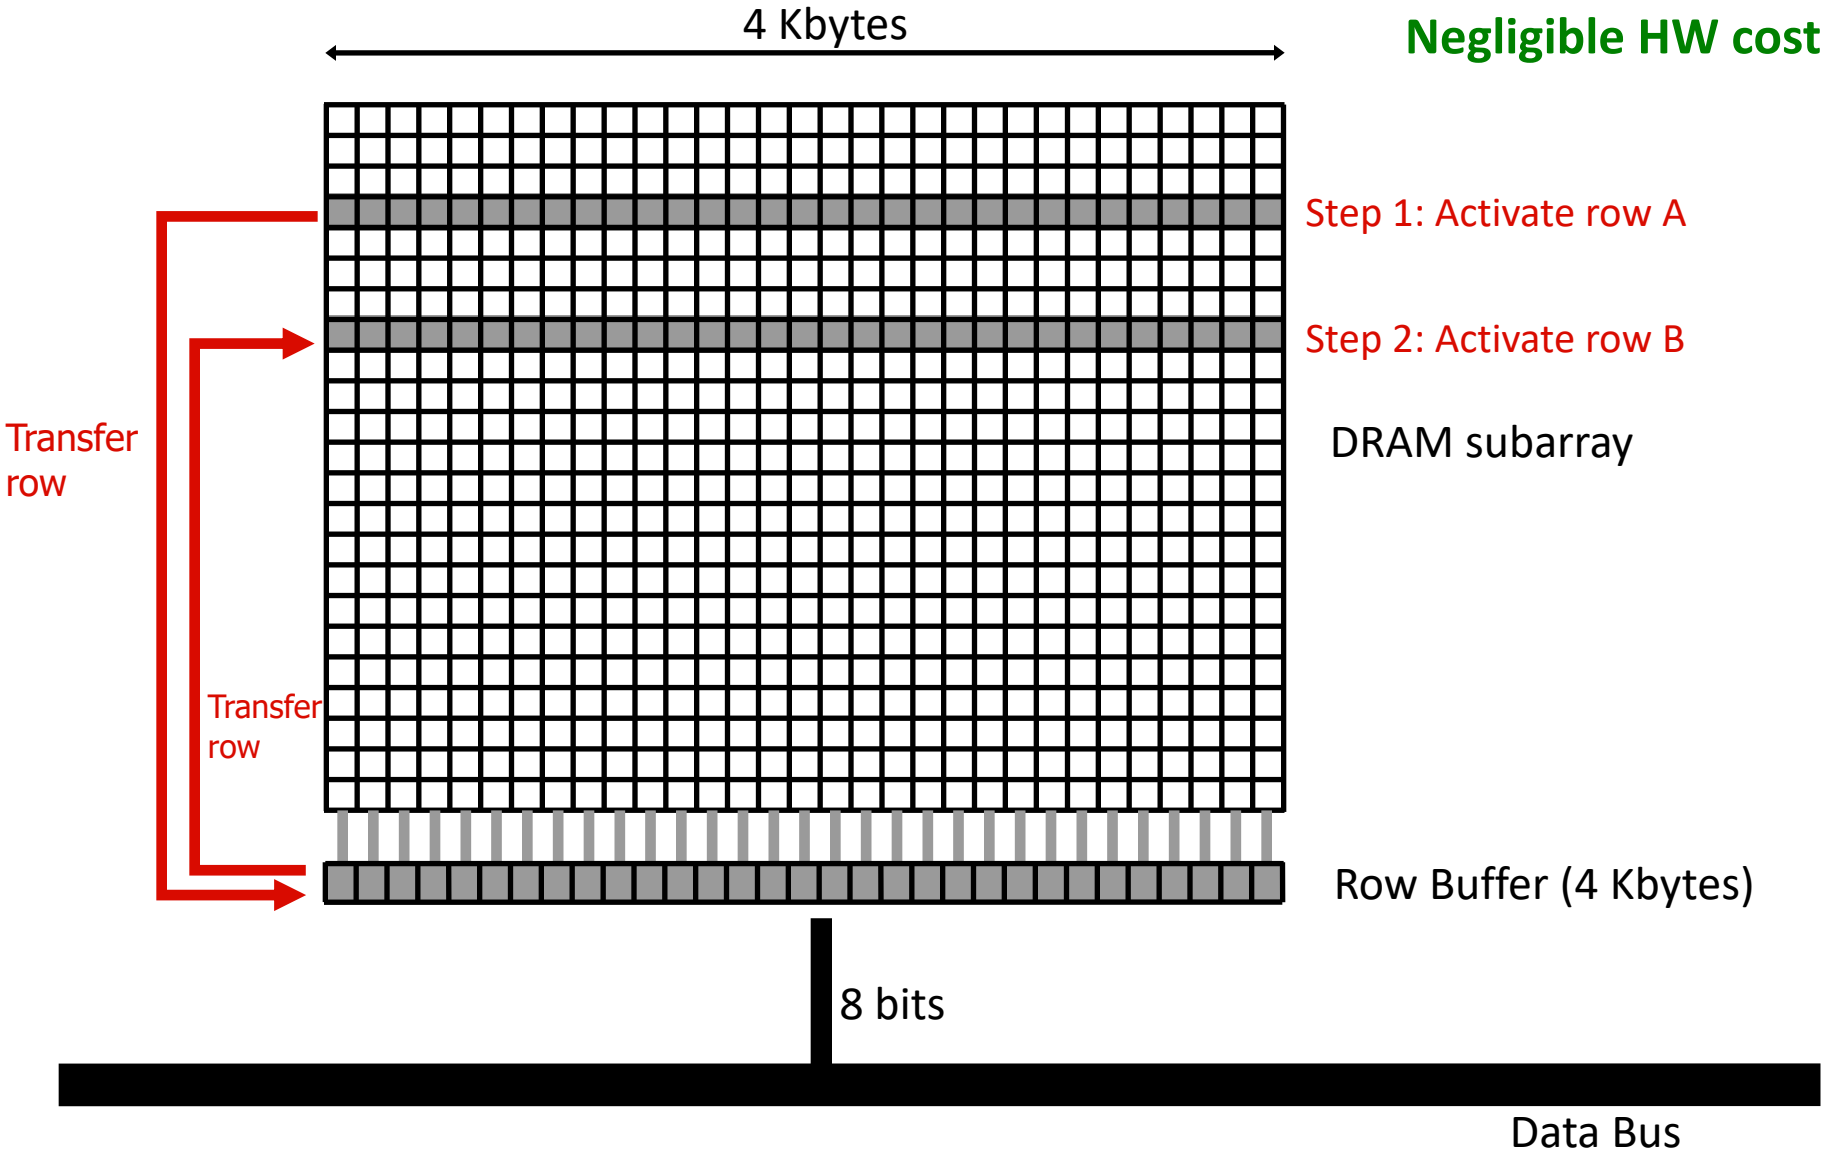
Future Systems: In-Memory Copy



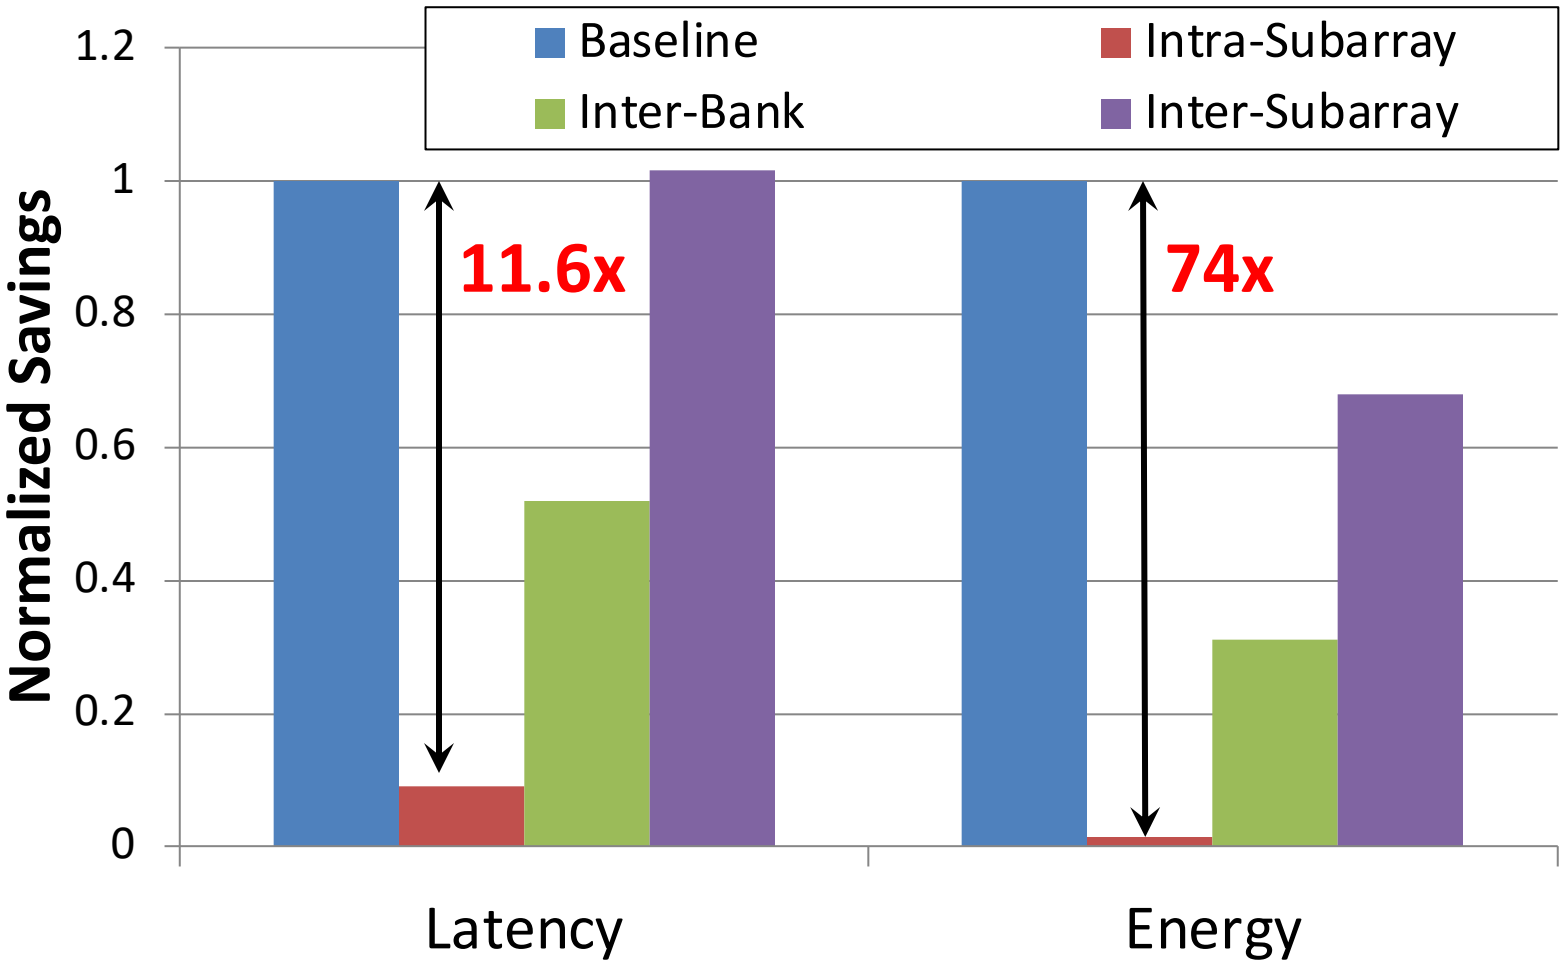
1046ns, 3.6uJ → 90ns, 0.04uJ

RowClone: In-DRAM Row Copy

Idea: Two consecutive ACTivates
Negligible HW cost



RowClone: Latency and Energy Savings



Seshadri et al., "RowClone: Fast and Efficient In-DRAM Copy and Initialization of Bulk Data," MICRO 2013.

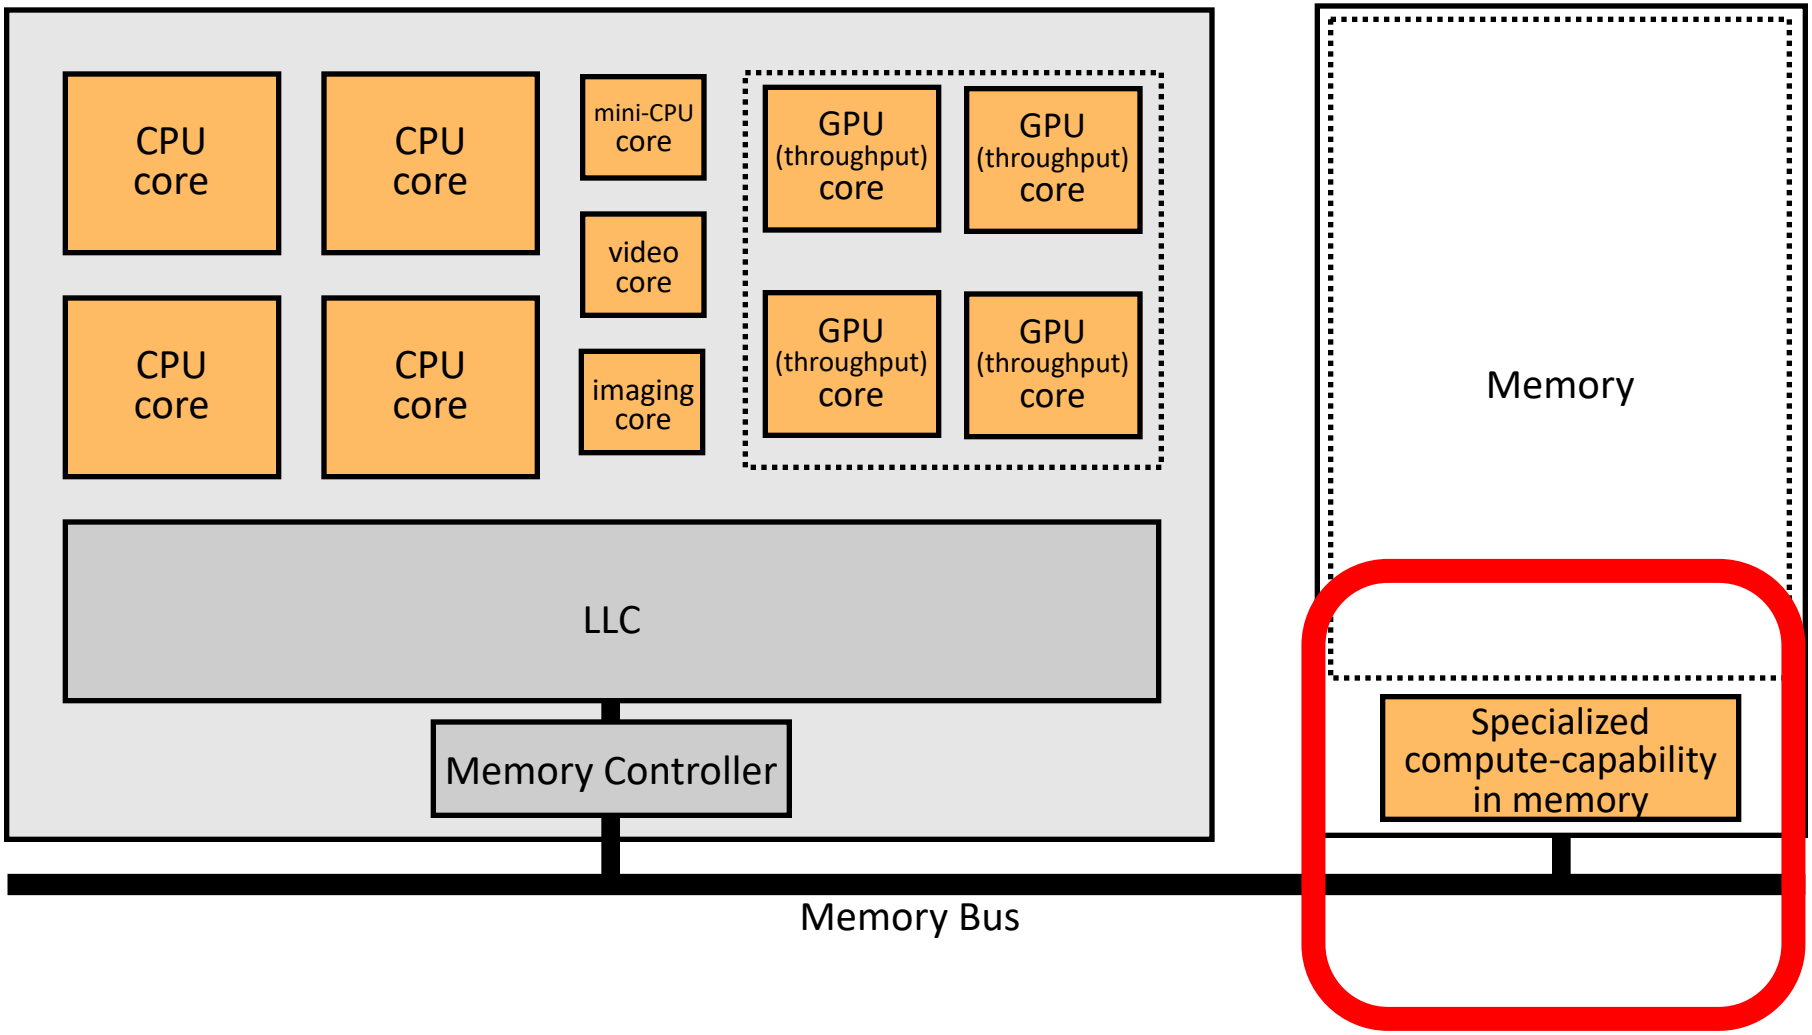
Memory as an Accelerator



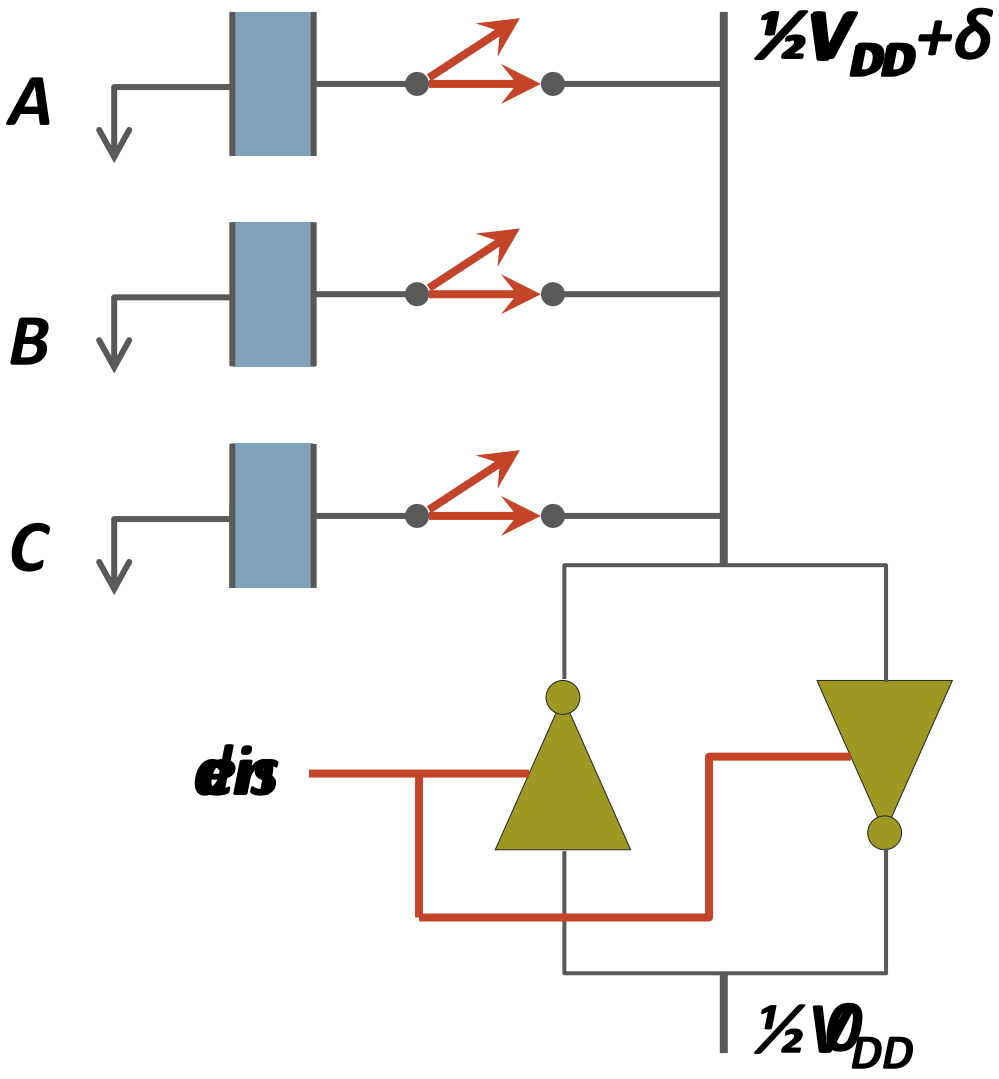
Memory similar to a "conventional" accelerator

In-Memory Bulk Bitwise Operations

- We can support in-DRAM COPY, ZERO, AND, OR, NOT, MAJ
- At low cost
- Using analog computation capability of DRAM
  - Idea: activating multiple rows performs computation
- 30-60X performance and energy improvement
  - Seshadri+, "Ambit: In-Memory Accelerator for Bulk Bitwise Operations Using Commodity DRAM Technology," MICRO 2017.

- New memory technologies enable even more opportunities
  - Memristors, resistive RAM, phase change mem, STT-MRAM, …
  - Can operate on data with minimal movement

In-DRAM AND/OR: Triple Row Activation



Final State
AB + BC + AC

C(A + B) + ~C(AB)

Seshadri+, "Fast Bulk Bitwise AND and OR in DRAM", IEEE CAL 2015.

In-DRAM NOT: Dual Contact Cell

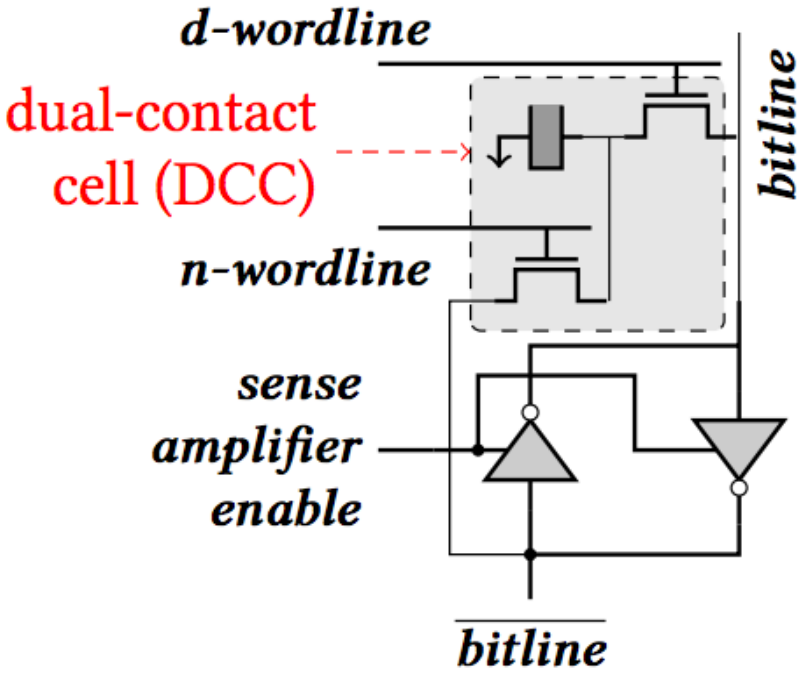


Figure 5: A dual-contact cell connected to both ends of a sense amplifier

Idea:

Feed the negated value in the sense amplifier into a special row

Seshadri+, "Ambit: In-Memory Accelerator for Bulk Bitwise Operations using Commodity DRAM Technology," MICRO 2017.

Performance: In-DRAM Bitwise Operations

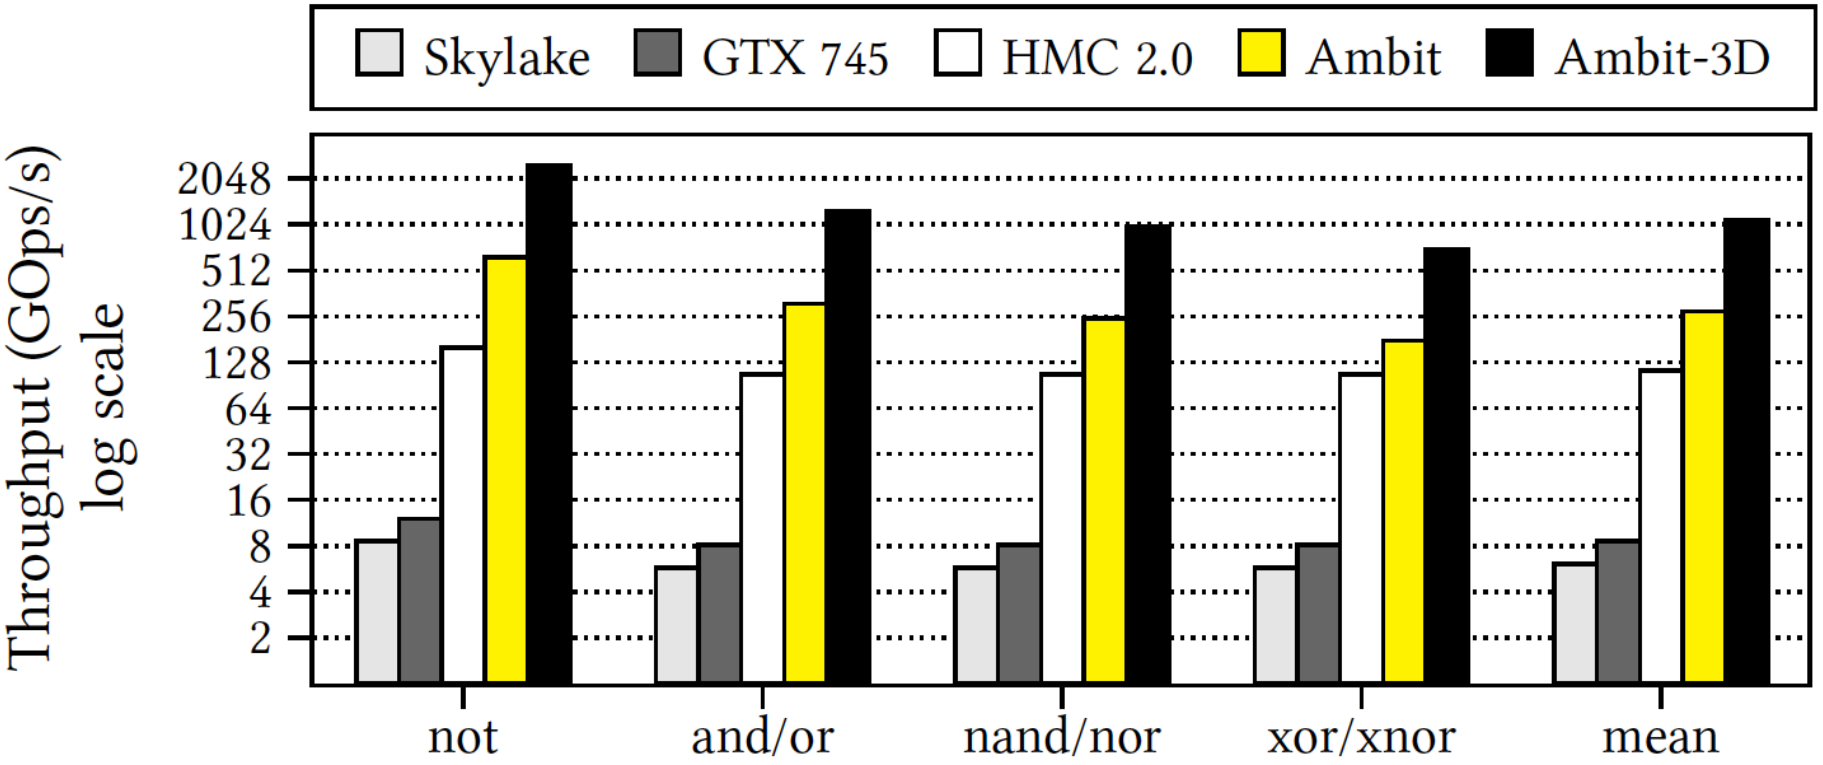

Figure 9: Throughput of bitwise operations on various systems.

Seshadri+, "Ambit: In-Memory Accelerator for Bulk Bitwise Operations using Commodity DRAM Technology," MICRO 2017.

Energy of In-DRAM Bitwise Operations

	Design	not	and/or	nand/nor	xor/xnor
DRAM &	**DDR3**	93.7	137.9	137.9	137.9
Channel Energy	**Ambit**	1.6	3.2	4.0	5.5
(nJ/KB)	(↓)	59.5X	43.9X	35.1X	25.1X

Table 3: Energy of bitwise operations. (↓) indicates energy reduction of Ambit over the traditional DDR3-based design.

Seshadri+, "Ambit: In-Memory Accelerator for Bulk Bitwise Operations using Commodity DRAM Technology," MICRO 2017.

Ambit vs. DDR3: Performance and Energy

Kim+, "Ramulator: A Flexible and Extensible DRAM Simulator", IEEE CAL 2015.

Two Key Questions in 3D-Stacked PIM

- What are the performance and energy benefits of using 3D-stacked memory as a coarse-grained accelerator?
  - By changing the entire system
  - By performing simple function offloading

- What is the minimal processing-in-memory support we can provide?
  - With minimal changes to system and programming

Graph Processing

- Large graphs are everywhere (circa 2015)

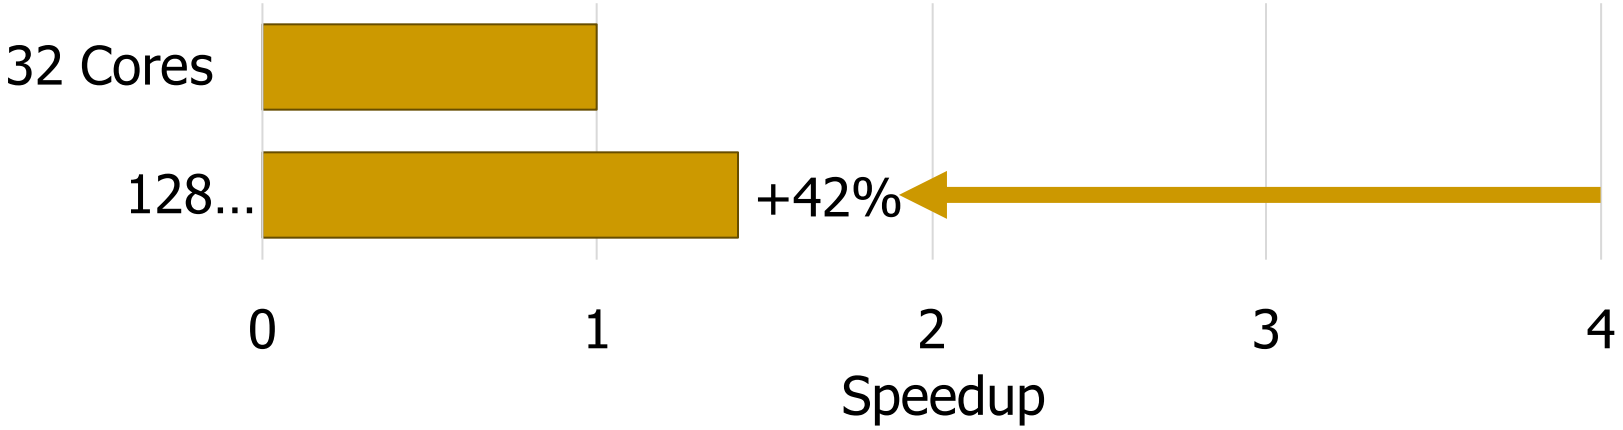
36 Million
Wikipedia Pages

1.4 Billion
Facebook Users

300 Million
Twitter Users

30 Billion
Instagram Photos

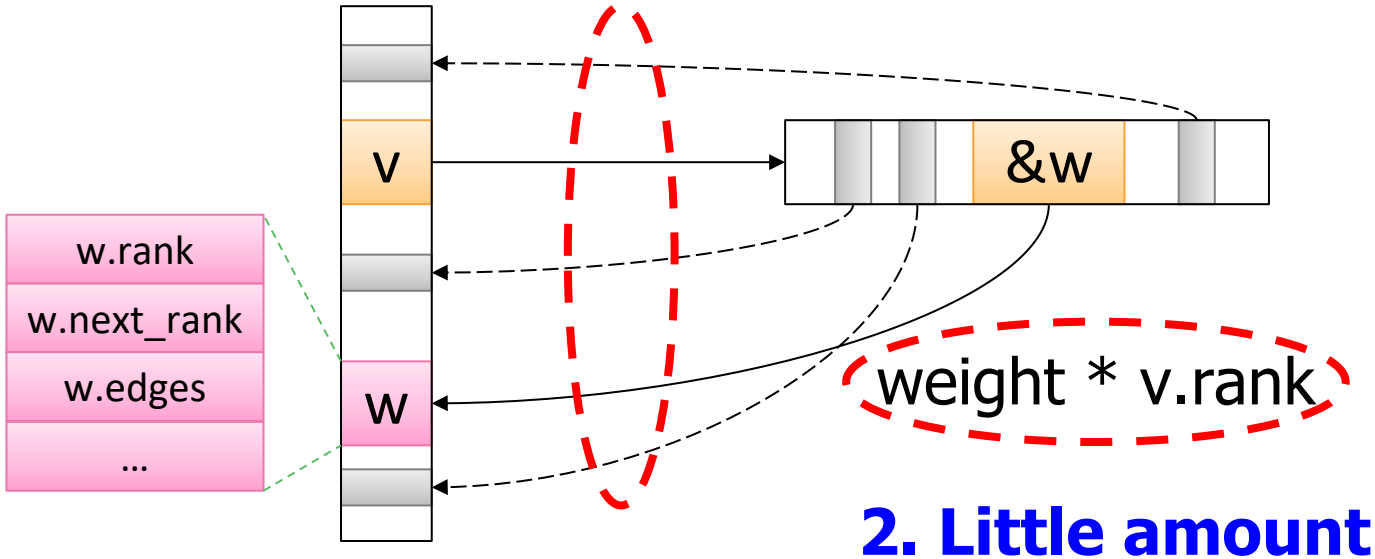
- Scalable large-scale graph processing is challenging



Key Bottlenecks in Graph Processing

```
for (v: graph.vertices) {
    for (w: v.successors) {
        w.next_rank += weight * v.rank;
    }
}
```

1. Frequent random memory accesses



2. Little amount of computation

YouTube

Video Playback

Google's video codec

VP9

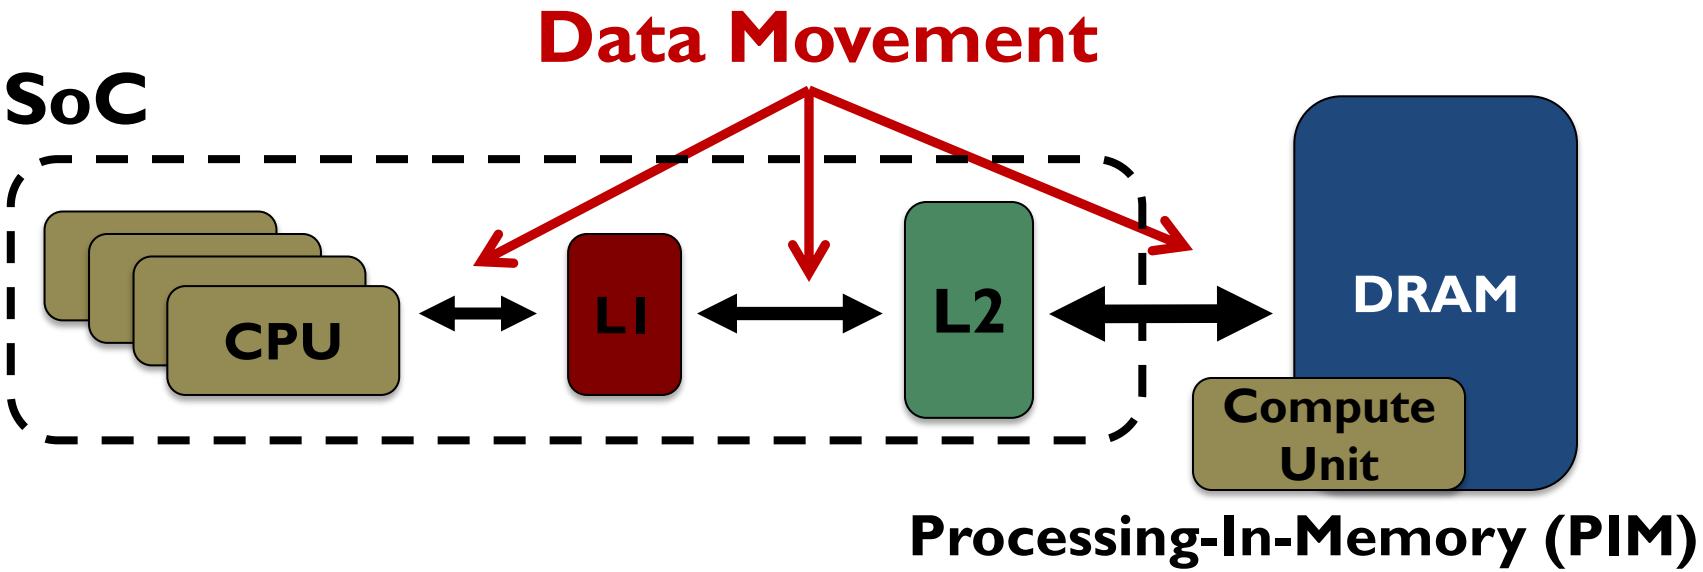
YouTube

Video Capture

Google's video codec

Energy Cost of Data Movement

1st key observation: 62.7% of the total system energy is spent on data movement



Potential solution: move computation close to data

Challenge: limited area and energy budget

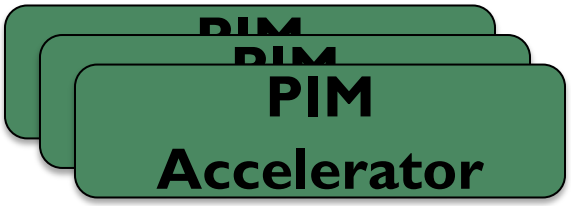
Using PIM to Reduce Data Movement

2nd key observation: a significant fraction of the data movement often comes from simple functions

We can design lightweight logic to implement these *simple functions* in memory

Small embedded low-power core

Small fixed-function accelerators



Offloading to PIM logic reduces energy and improves performance, on average, by 55.4% and 54.2%

TensorFlow Mobile

57.3% of the inference energy is spent on **data movement**

↓

54.4% of the **data movement** energy comes from **packing/unpacking** and **quantization**

Packing

Reorders elements of matrices to minimize **cache misses** during **matrix multiplication**

Up to **40%** of the inference **energy** and **31%** of inference **execution time**

Packing's data movement accounts for up to **35.3%** of the inference **energy**

A simple data reorganization process that requires simple arithmetic

Quantization

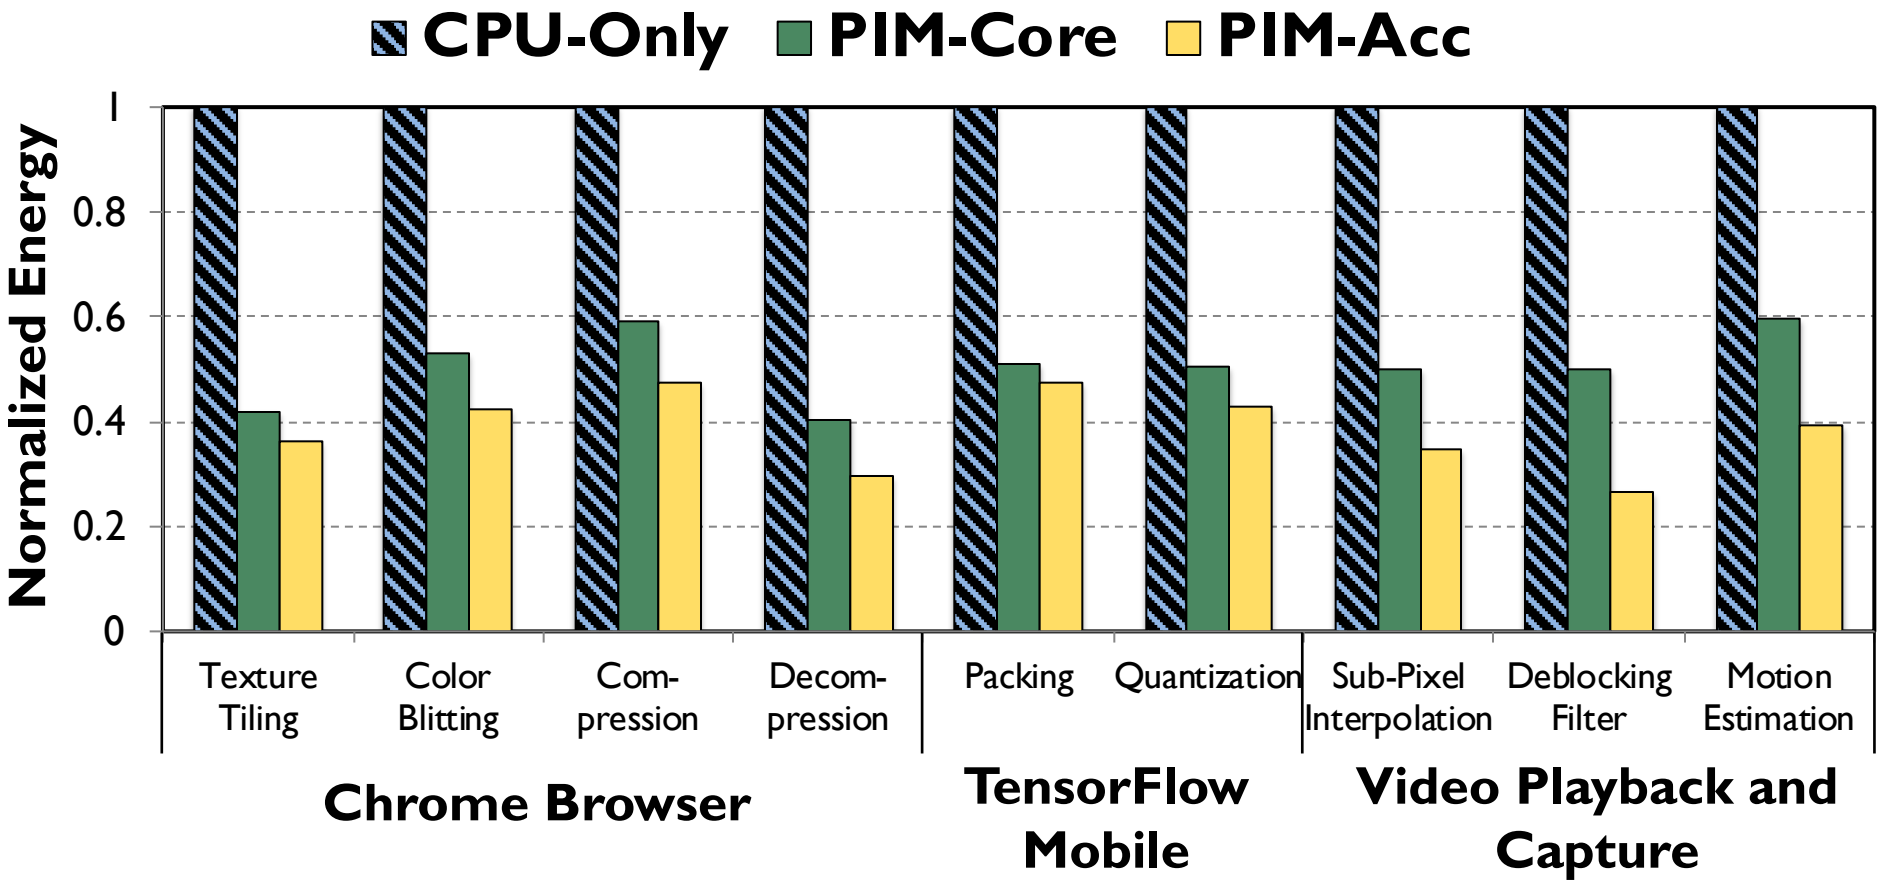
Converts 32-bit floating point to 8-bit integers to improve inference execution time and energy consumption

Up to 16.8% of the inference energy and 16.1% of inference execution time

Majority of quantization energy comes from data movement

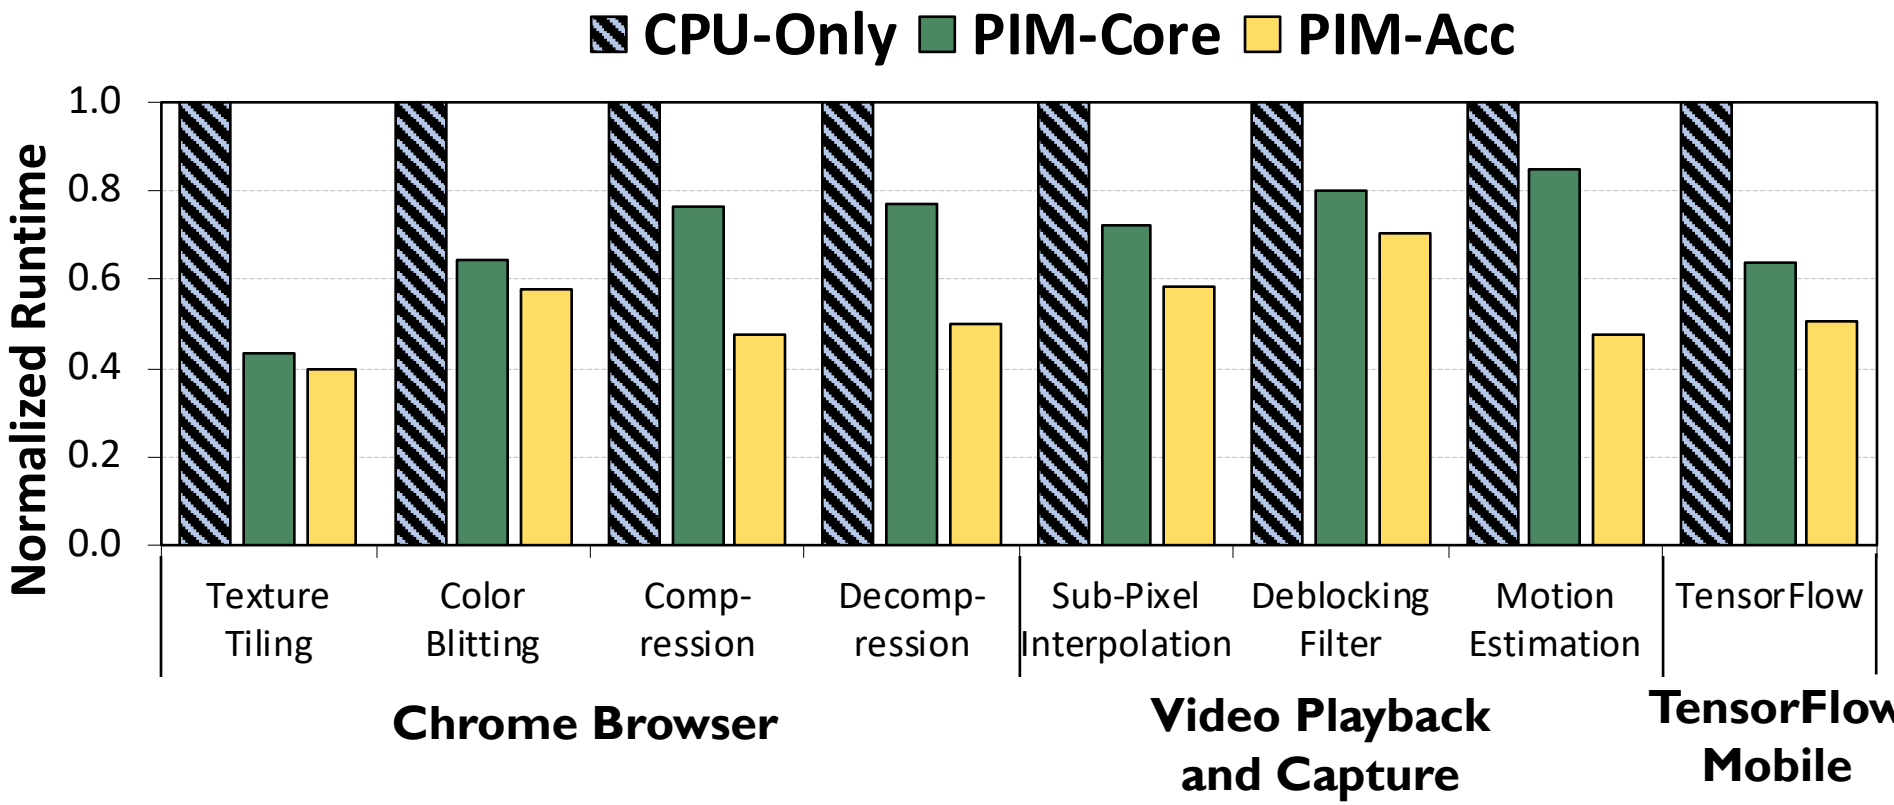
A simple data conversion operation that requires shift, addition, and multiplication operations

Normalized Energy



PIM core and PIM accelerator reduce energy consumption on average by 49.1% and 55.4%

Normalized Runtime



Offloading these kernels to PIM core and PIM accelerator improves performance on average by 44.6% and 54.2%

Two Key Questions in 3D-Stacked PIM

- What are the performance and energy benefits of using 3D-stacked memory as a coarse-grained accelerator?
  - By changing the entire system
  - By performing simple function offloading

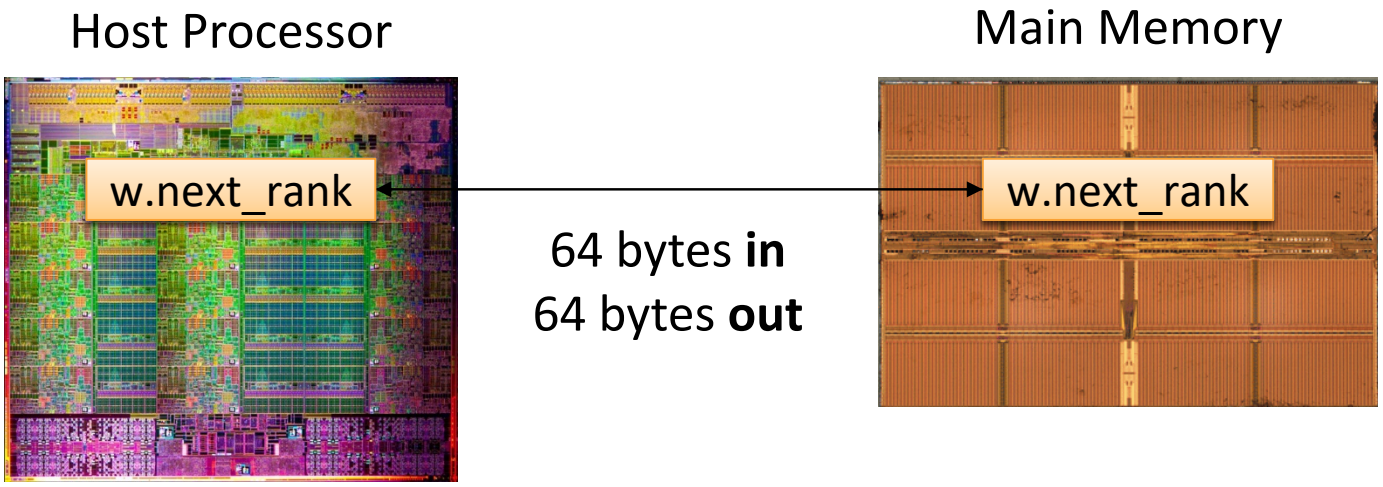
- What is the minimal processing-in-memory support we can provide?
  - With minimal changes to system and programming

PEI: PIM-Enabled Instructions (Ideas)

- Goal: Develop mechanisms to get the most out of near-data processing with minimal cost, minimal changes to the system, no changes to the programming model
- Key Idea 1: Expose each PIM operation as a cache-coherent, virtually-addressed host processor instruction (called PEI) that operates on only a single cache block
  - e.g., __pim_add(&w.next_rank, value) → pim.add r1, (r2)
  - No changes sequential execution/programming model
  - No changes to virtual memory
  - Minimal changes to cache coherence
  - No need for data mapping: Each PEI restricted to a single memory module
- Key Idea 2: Dynamically decide where to execute a PEI (i.e., the host processor or PIM accelerator) based on simple locality characteristics and simple hardware predictors
  - Execute each operation at the location that provides the best performance

Simple PIM Operations as ISA Extensions (II)

```
for (v: graph.vertices) {
    value = weight * v.rank;
    for (w: v.successors) {
        w.next_rank += value;
    }
}
```

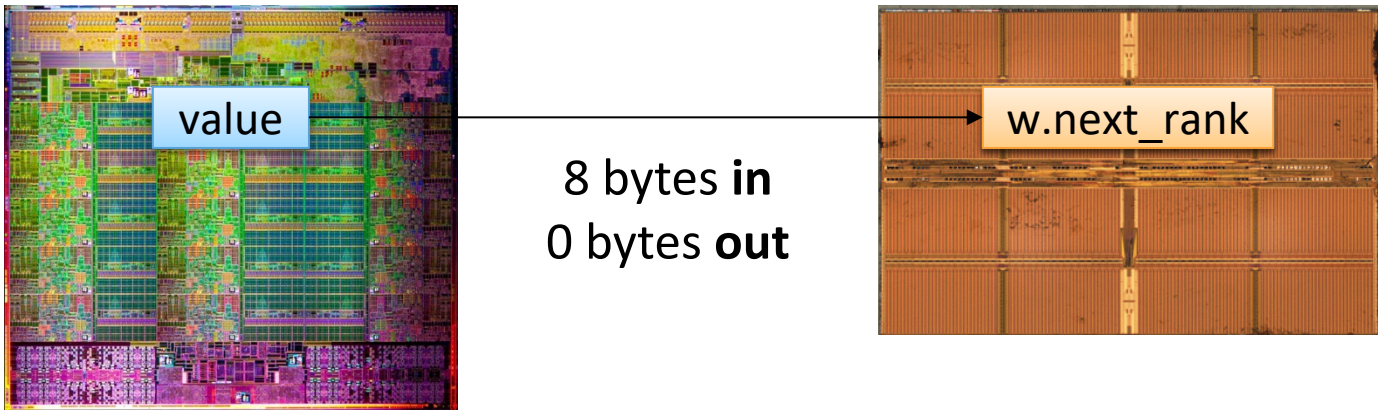


Conventional Architecture

Simple PIM Operations as ISA Extensions (III)

```
for (v: graph.vertices) {
    value = weight * v.rank;
    for (w: v.successors) {
        __pim_add(&w.next_rank, value);
    }
}
```

pim.add r1, (r2)



In-Memory Addition

PEI: PIM-Enabled Instructions (Example)

```
for (v: graph.vertices) {
  value = weight * v.rank;
  for (w: v.successors) {
    __pim_add(&w.next_rank, value);
  }
}
pfence();
```

pim.add r1, (r2)

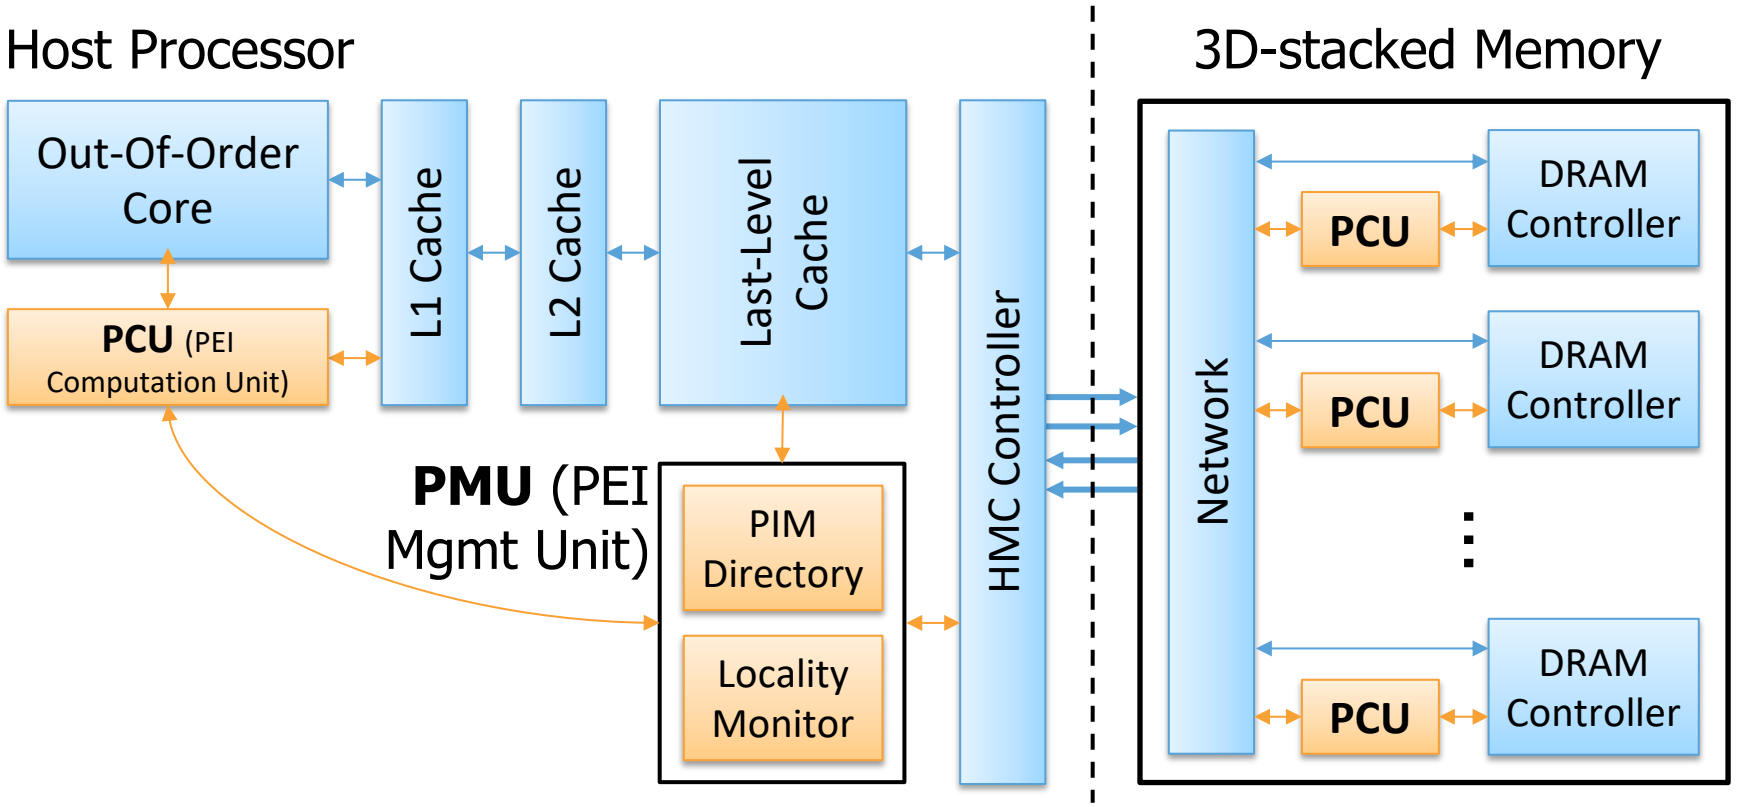
pfence

Table 1: Summary of Supported PIM Operations

Operation	R	W	Input	Output	Applications
8-byte integer increment	O	O	0 bytes	0 bytes	AT
8-byte integer min	O	O	8 bytes	0 bytes	BFS, SP, WCC
Floating-point add	O	O	8 bytes	0 bytes	PR
Hash table probing	O	X	8 bytes	9 bytes	HJ
Histogram bin index	O	X	1 byte	16 bytes	HG, RP
Euclidean distance	O	X	64 bytes	4 bytes	SC
Dot product	O	X	32 bytes	8 bytes	SVM

- Executed either in memory or in the processor: dynamic decision
  - Low-cost locality monitoring for a single instruction
- Cache-coherent, virtually-addressed, single cache block only
- Atomic between different PEIs
- *Not* atomic with normal instructions (use *pfence* for ordering)

Example (Abstract) PEI uArchitecture



Example PEI uArchitecture

PEI: Initial Evaluation Results

- Initial evaluations with 10 emerging data-intensive workloads
  - Large-scale graph processing
  - In-memory data analytics
  - Machine learning and data mining
  - Three input sets (small, medium, large) for each workload to analyze the impact of data locality

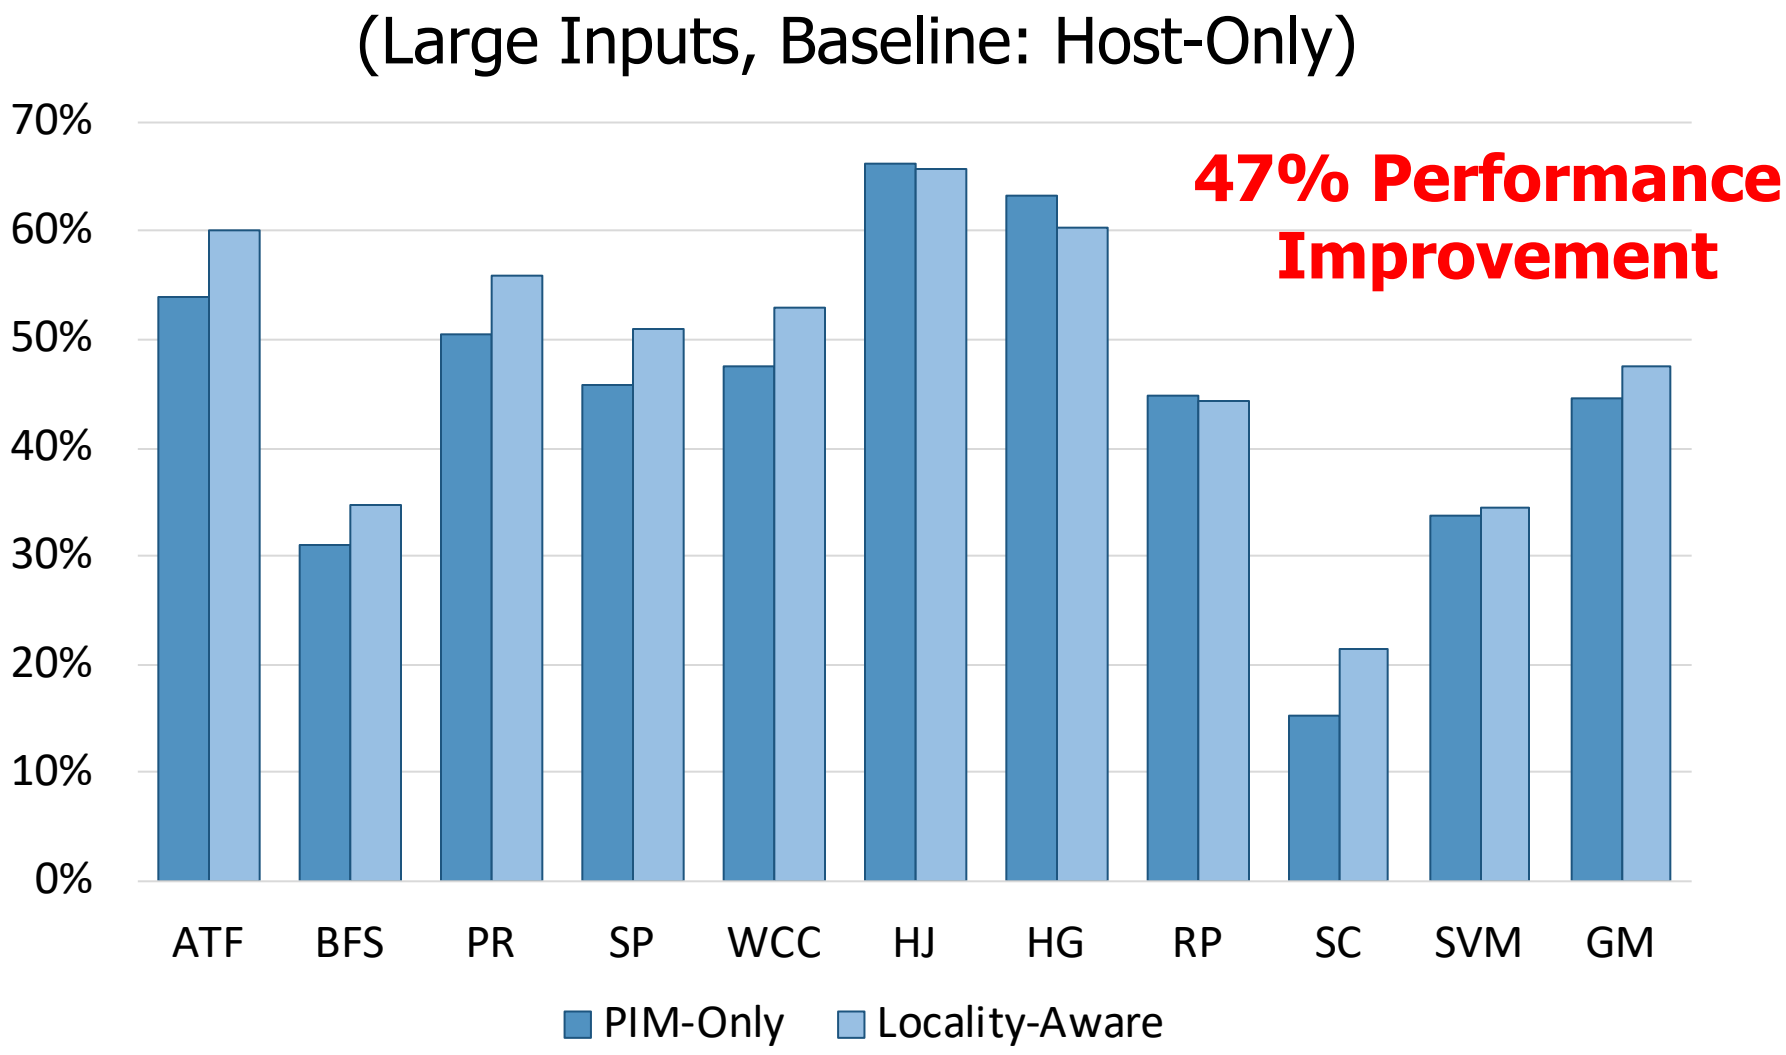
Table 2: Baseline Simulation Configuration

Component	Configuration
Core	16 out-of-order cores, 4 GHz, 4-issue
L1 I/D-Cache	Private, 32 KB, 4/8-way, 64 B blocks, 16 MSHRs
L2 Cache	Private, 256 KB, 8-way, 64 B blocks, 16 MSHRs
L3 Cache	Shared, 16 MB, 16-way, 64 B blocks, 64 MSHRs
On-Chip Network	Crossbar, 2 GHz, 144-bit links
Main Memory	32 GB, 8 HMCs, daisy-chain (80 GB/s full-duplex)
HMC	4 GB, 16 vaults, 256 DRAM banks [20]
– DRAM	FR-FCFS, tCL = tRCD = tRP = 13.75 ns [27]
– Vertical Links	64 TSVs per vault with 2 Gb/s signaling rate [23]

- Pin-based cycle-level x86-64 simulation

- **Performance Improvement and Energy Reduction:**
  - 47% average speedup with large input data sets
  - 32% speedup with small input data sets
  - 25% avg. energy reduction in a single node with large input data sets

PEI Performance Delta: Large Data Sets



PEI Energy Consumption

25% Energy Reduction

Computing Architectures with Minimal Data Movement

Agenda

- Major Trends Affecting Main Memory
- The Need for Intelligent Memory Controllers
  - Bottom Up: Push from Circuits and Devices
  - Top Down: Pull from Systems and Applications
- Processing in Memory: Two Directions
  - Minimally Changing Memory Chips
  - Exploiting 3D-Stacked Memory
- How to Enable Adoption of Processing in Memory
- Conclusion

Eliminating the Adoption Barriers

How to Enable Adoption of Processing in Memory

Barriers to Adoption of PIM

1. Functionality of and applications & software for PIM

2. Ease of programming (interfaces and compiler/HW support)

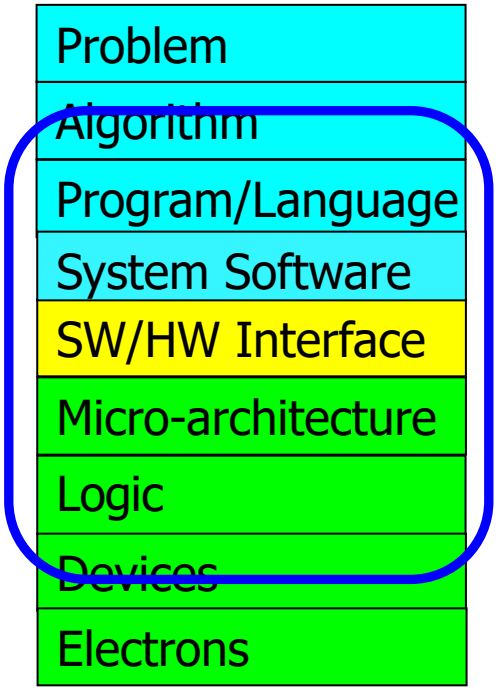
3. System support: coherence & virtual memory

4. Runtime and compilation systems for adaptive scheduling, data mapping, access/sharing control

5. Infrastructures and models to assess benefits and feasibility

All can be solved with change of mindset

We Need to Revisit the Entire Stack



We can get there step by step

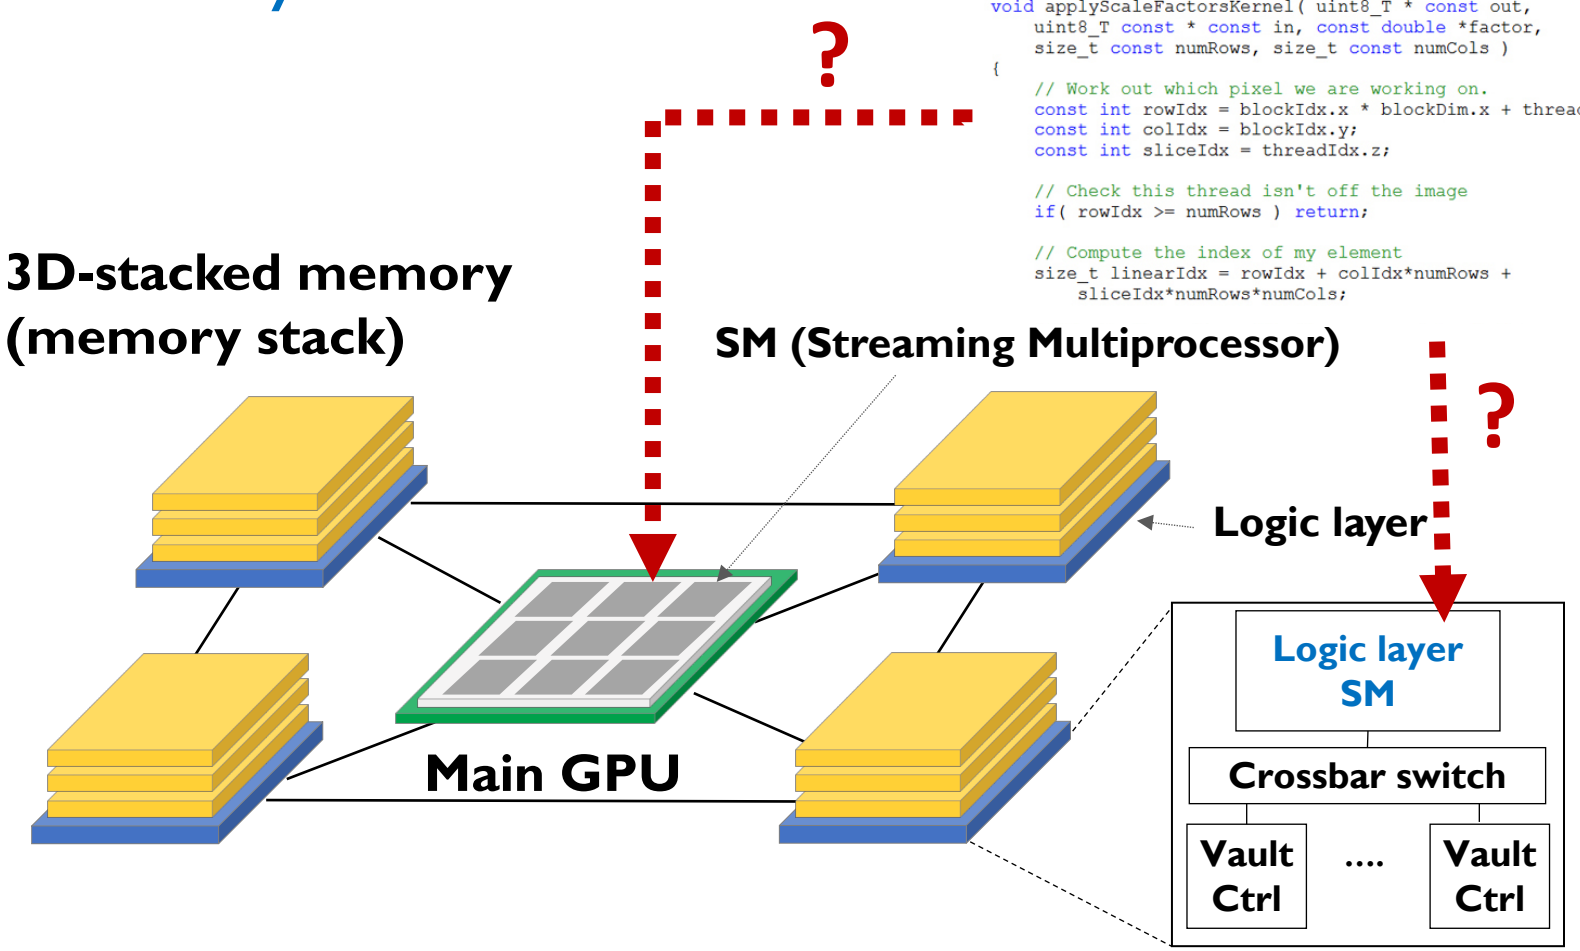
Key Challenge 1: Code Mapping

- **Challenge 1:** Which operations should be executed in memory vs. in CPU?

```
__global__
void applyScaleFactorsKernel( uint8_T * const out,
    uint8_T const * const in, const double *factor,
    size_t const numRows, size_t const numCols )
{
    // Work out which pixel we are working on.
    const int rowIdx = blockIdx.x * blockDim.x + threadIdx.x;
    const int colIdx = blockIdx.y;
    const int sliceIdx = threadIdx.z;

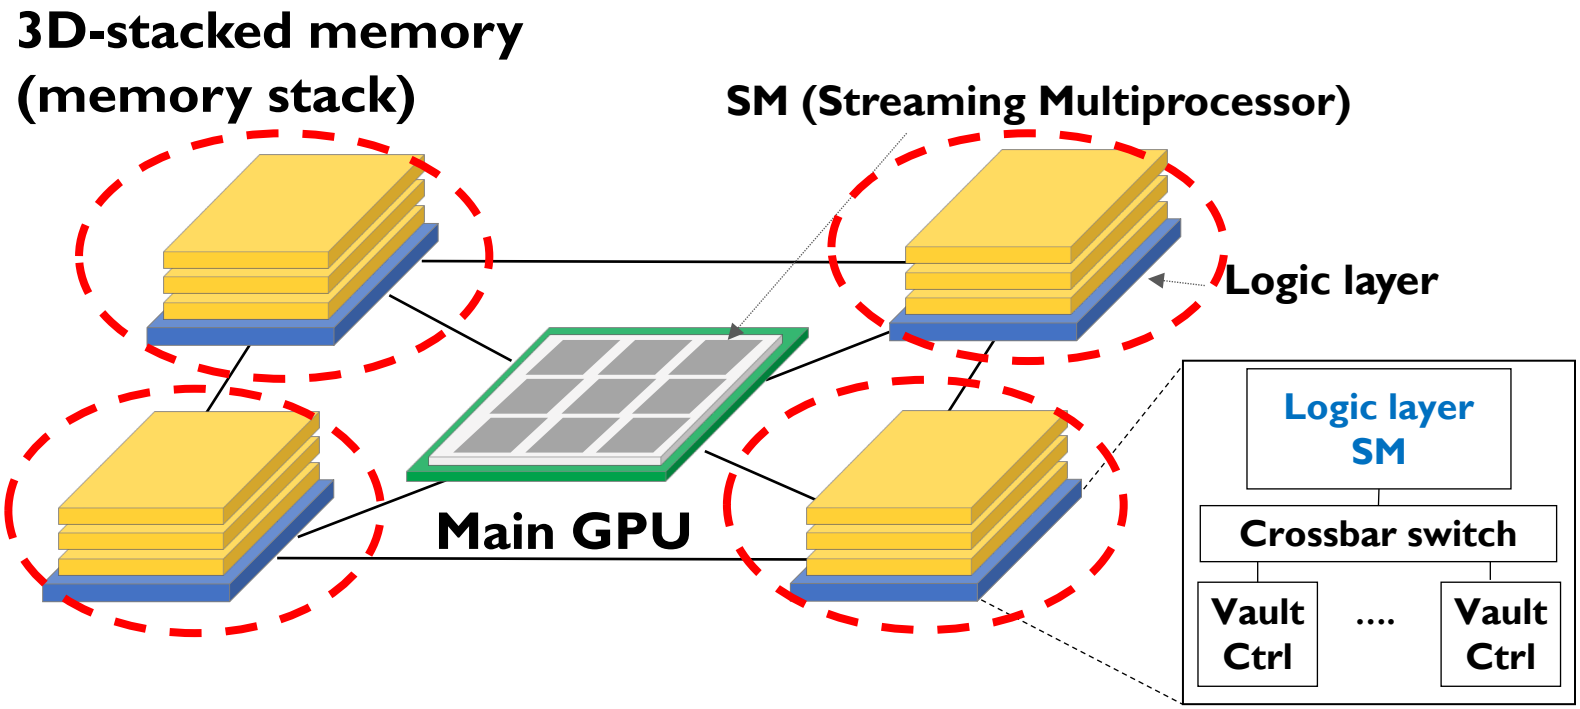
    // Check this thread isn't off the image
    if( rowIdx >= numRows ) return;

    // Compute the index of my element
    size_t linearIdx = rowIdx + colIdx*numRows +
        sliceIdx*numRows*numCols;
```



Key Challenge 2: Data Mapping

- **Challenge 2:** How should data be mapped to different 3D memory stacks?



How to Do the Code and Data Mapping?

- Kevin Hsieh, Eiman Ebrahimi, Gwangsun Kim, Niladrish Chatterjee, Mike O'Connor, Nandita Vijaykumar, Onur Mutlu, and Stephen W. Keckler, **"Transparent Offloading and Mapping (TOM): Enabling Programmer-Transparent Near-Data Processing in GPU Systems"**

Executive Summary

- **Genome Read Mapping** is a very important problem and is the first step in many types of genomic analysis
  - Could lead to improved health care, medicine, quality of life
- Read mapping is an **approximate string matching** problem
  - Find the best fit of 100 character strings into a 3 billion character dictionary
  - **Alignment** is currently the best method for determining the similarity between two strings, but is **very expensive**
- We propose an in-memory processing algorithm **GRIM-Filter** for accelerating read mapping, by reducing the number of required alignments
- We implement GRIM-Filter using **in-memory processing** within **3D-stacked memory** and show up to **3.7x speedup**.

Challenge and Opportunity for Future

Fundamentally Energy-Efficient (Data-Centric) Computing Architectures

Challenge and Opportunity for Future

Fundamentally Low-Latency (Data-Centric) Computing Architectures

Computing Architectures with Minimal Data Movement

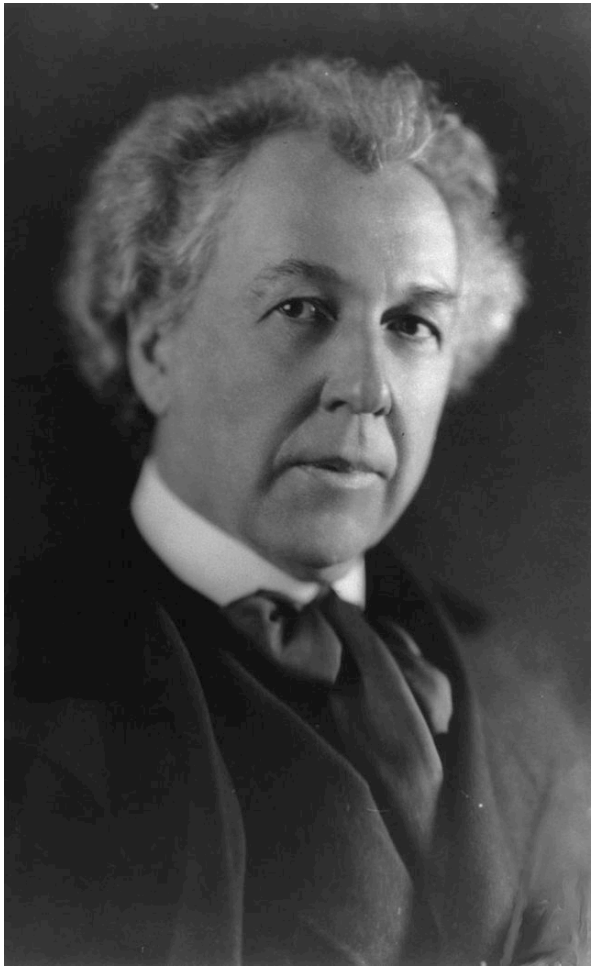
Key Takeaway

Main Memory Needs Intelligent Controllers

Concluding Remarks

A Quote from A Famous Architect

- "architecture [...] based upon principle, and not upon precedent"

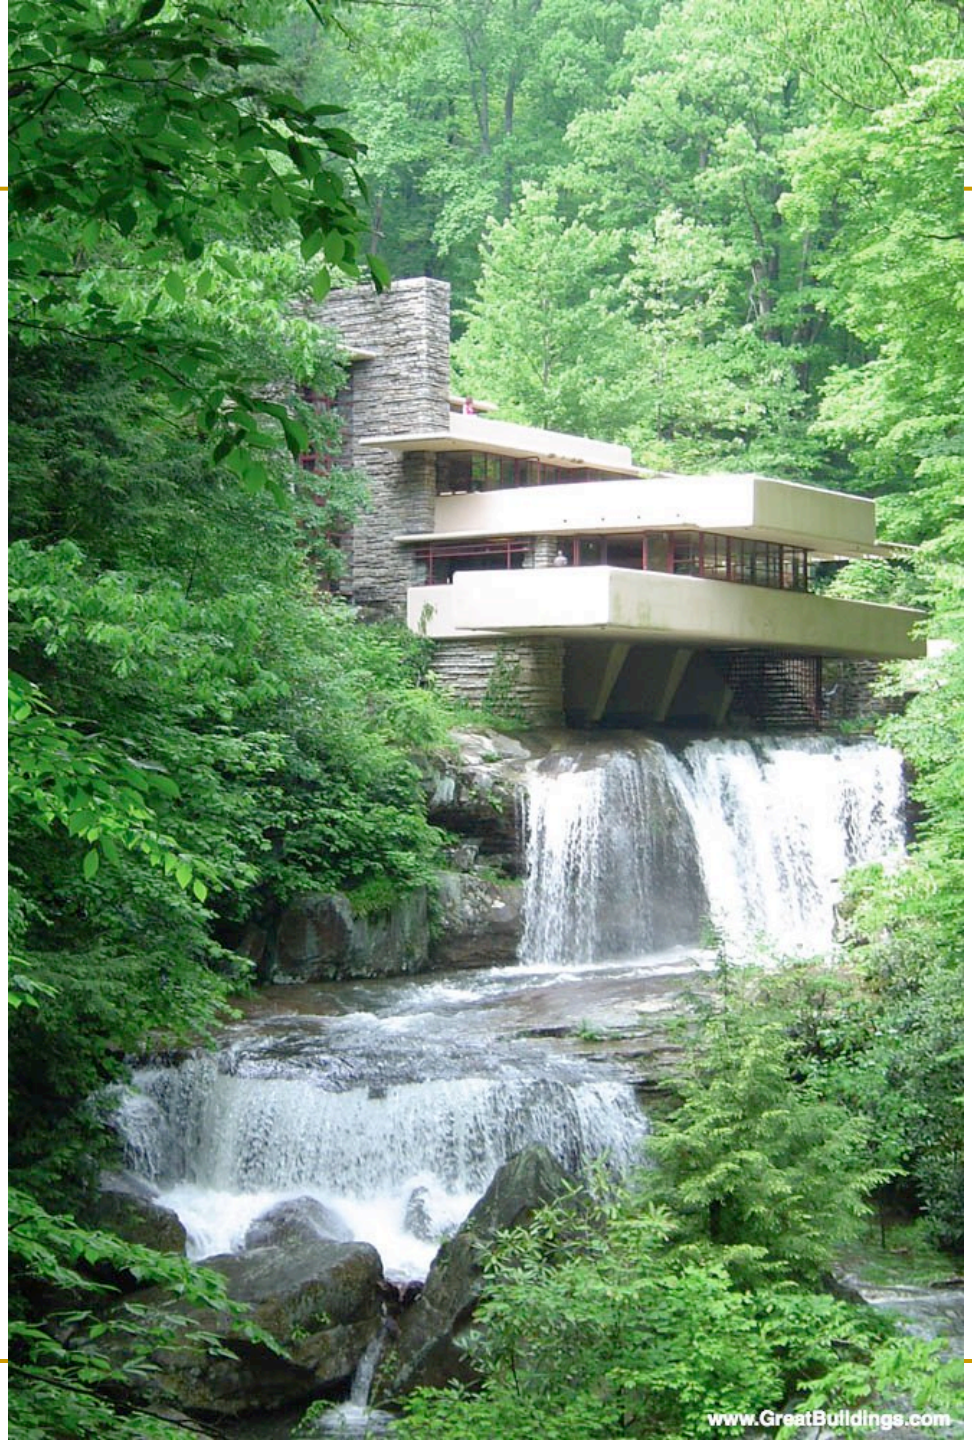


Precedent-Based Design?

- "architecture […] based upon principle, and not upon precedent"

Principled Design

- "architecture [...] based upon principle, and not upon precedent"



www.GreatBuildings.com

The Overarching Principle

Organic architecture

From Wikipedia, the free encyclopedia

Organic architecture is a philosophy of architecture which promotes harmony between human habitation and the natural world through design approaches so sympathetic and well integrated with its site, that buildings, furnishings, and surroundings become part of a unified, interrelated composition.

A well-known example of organic architecture is Fallingwater, the residence Frank Lloyd Wright designed for the Kaufmann family in rural Pennsylvania. Wright had many choices to locate a home on this large site, but chose to place the home directly over the waterfall and creek creating a close, yet noisy dialog with the rushing water and the steep site. The horizontal striations of stone masonry with daring cantilevers of colored beige concrete blend with native rock outcroppings and the wooded environment.

Another Example: Precedent-Based Design

Source: https://www.dezeen.com/2016/08/29/santiago-calatrava-oculus-world-trade-center-transportation-hub-new-york-photographs-hufton-crow/

The Overarching Principle

Zoomorphic architecture

From Wikipedia, the free encyclopedia

Zoomorphic architecture is the practice of using animal forms as the inspirational basis and blueprint for architectural design. "While animal forms have always played a role adding some of the deepest layers of meaning in architecture, it is now becoming evident that a new strand of biomorphism is emerging where the meaning derives not from any specific representation but from a more general allusion to biological processes."[1]

Some well-known examples of Zoomorphic architecture can be found in the TWA Flight Center building in New York City, by Eero Saarinen, or the Milwaukee Art Museum by Santiago Calatrava, both inspired by the form of a bird's wings.[3]

Overarching Principle for Computing?

Source: http://spectrum.ieee.org/image/MjYzMzAyMg.jpeg

Concluding Remarks

- It is time to design principled system architectures to solve the memory problem
- Design complete systems to be balanced, high-performance, and energy-efficient, i.e., data-centric (or memory-centric)
- Enable computation capability inside and close to memory
- This can
  - Lead to **orders-of-magnitude** improvements
  - **Enable new applications & computing platforms**
  - **Enable better understanding of nature**
  - **…**

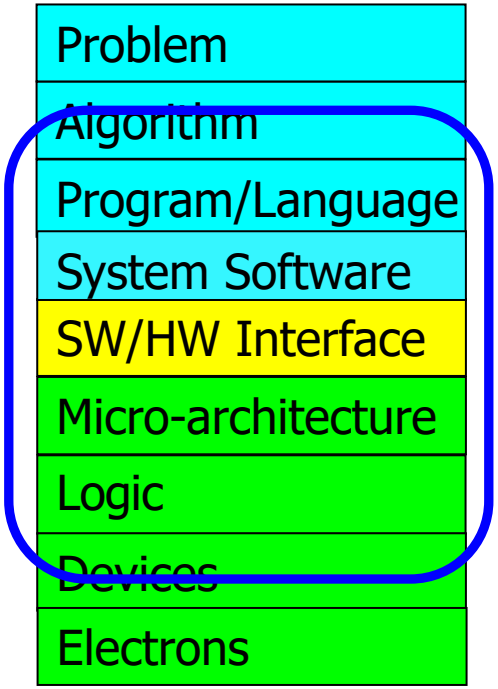
The Future of Processing in Memory is Bright

- Regardless of challenges
  - in underlying technology and overlying problems/requirements

Can enable:

- Orders of magnitude improvements

- New applications and computing systems

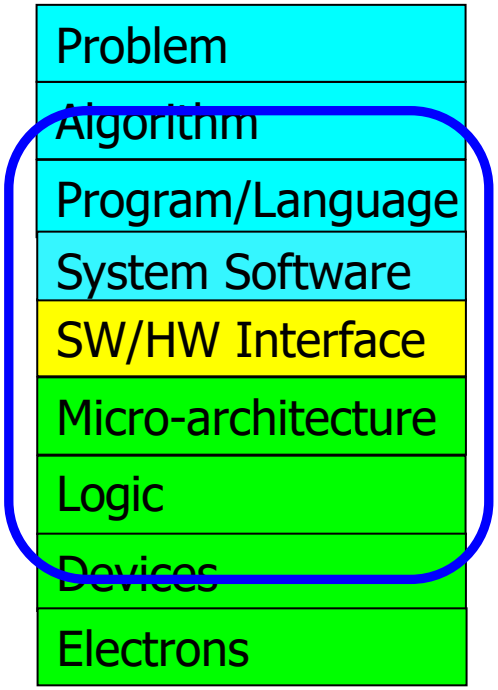


Yet, we have to

- Think across the stack

- Design enabling systems

We Need to Revisit the Entire Stack



We can get there step by step

If In Doubt, See Other Doubtful Technologies

- A very "doubtful" emerging technology
  - for at least two decades

Proceedings of the IEEE, Sept. 2017

Error Characterization, Mitigation, and Recovery in Flash-Memory-Based Solid-State Drives

This paper reviews the most recent advances in solid-state drive (SSD) error characterization, mitigation, and data recovery techniques to improve both SSD's reliability and lifetime.

Proceedings of the IEEE, Sept. 2017

Error Characterization, Mitigation, and Recovery in Flash-Memory-Based Solid-State Drives

This paper reviews the most recent advances in solid-state drive (SSD) error characterization, mitigation, and data recovery techniques to improve both SSD's reliability and lifetime.

Ramulator: A Fast and Extensible DRAM Simulator

[IEEE Comp Arch Letters'15]

Ramulator Motivation

- DRAM and Memory Controller landscape is changing
- Many new and upcoming standards
- Many new controller designs
- A fast and easy-to-extend simulator is very much needed

Segment	*DRAM Standards & Architectures*
Commodity	DDR3 (2007) [14]; DDR4 (2012) [18]
Low-Power	LPDDR3 (2012) [17]; LPDDR4 (2014) [20]
Graphics	GDDR5 (2009) [15]
Performance	eDRAM [28], [32]; RLDRAM3 (2011) [29]
3D-Stacked	WIO (2011) [16]; WIO2 (2014) [21]; MCDRAM (2015) [13]; HBM (2013) [19]; HMC1.0 (2013) [10]; HMC1.1 (2014) [11]
Academic	SBA/SSA (2010) [38]; Staged Reads (2012) [8]; RAIDR (2012) [27]; SALP (2012) [24]; TL-DRAM (2013) [26]; RowClone (2013) [37]; Half-DRAM (2014) [39]; Row-Buffer Decoupling (2014) [33]; SARP (2014) [6]; AL-DRAM (2015) [25]

Table 1. Landscape of DRAM-based memory

Ramulator

- Provides out-of-the box support for many DRAM standards:
  - DDR3/4, LPDDR3/4, GDDR5, WIO1/2, HBM, plus new proposals (SALP, AL-DRAM, TLDRAM, RowClone, and SARP)
- ~2.5X faster than fastest open-source simulator
- Modular and extensible to different standards

Simulator (clang -O3)	*Cycles (10^6)*		*Runtime (sec.)*		*Req/sec (10^3)*		*Memory (MB)*
	Random	*Stream*	*Random*	*Stream*	*Random*	*Stream*	
Ramulator	652	411	752	249	133	402	2.1
DRAMSim2	645	413	2,030	876	49	114	1.2
USIMM	661	409	1,880	750	53	133	4.5
DrSim	647	406	18,109	12,984	6	8	1.6
NVMain	666	413	6,881	5,023	15	20	4,230.0

Table 3. Comparison of five simulators using two traces

Case Study: Comparison of DRAM Standards

Standard	*Rate (MT/s)*	*Timing (CL-RCD-RP)*	*Data-Bus (Width×Chan.)*	*Rank-per-Chan*	*BW (GB/s)*
DDR3	1,600	11-11-11	64-bit × 1	1	11.9
DDR4	2,400	16-16-16	64-bit × 1	1	17.9
SALP†	1,600	11-11-11	64-bit × 1	1	11.9
LPDDR3	1,600	12-15-15	64-bit × 1	1	11.9
LPDDR4	2,400	22-22-22	32-bit × 2*	1	17.9
GDDR5 [12]	6,000	18-18-18	64-bit × 1	1	44.7
HBM	1,000	7-7-7	128-bit × 8*	1	119.2
WIO	266	7-7-7	128-bit × 4*	1	15.9
WIO2	1,066	9-10-10	128-bit × 8*	1	127.2

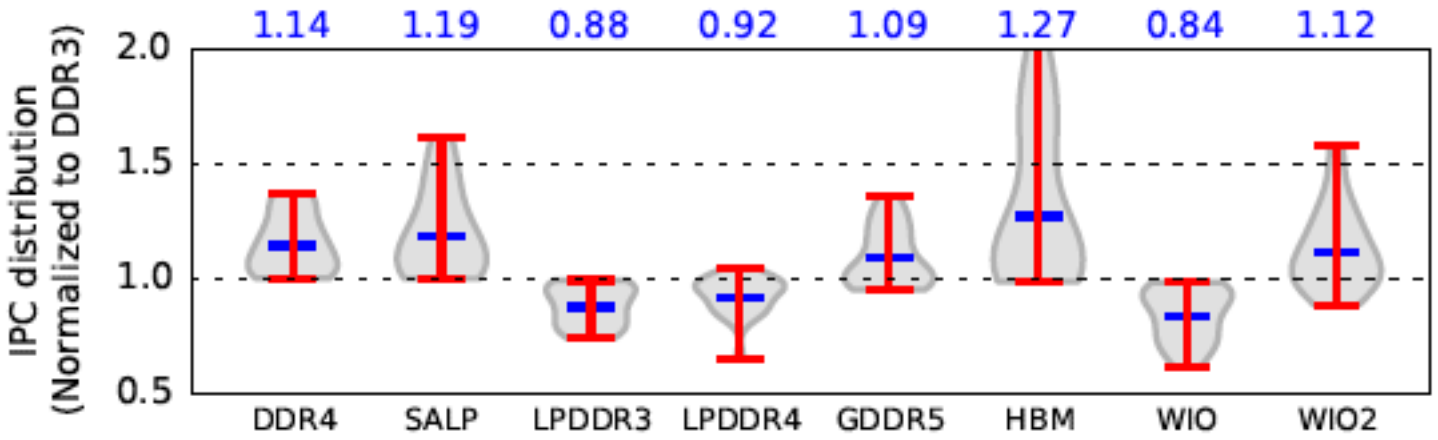

Figure 2. Performance comparison of DRAM standards

Across 22 workloads, simple CPU model
