

## 12<sup>th</sup> Homework - Solution

- In this homework, we shall model chemical reactions using reaction rate equations only.
- We shall program the reaction rate equations directly in the equation window and learn to use *Modelica's* matrix notation.

- [Hydrogen-Bromine Reaction](#)
- [Oxy-hydrogen Gas Reaction](#)

## Hydrogen-Bromine Reaction

- We wish to simulate the *hydrogen-bromine reaction* described during the lectures. We concentrate on mass flows only, i.e., we only model the reaction rate equations.
- We wish to plot the molar masses of the five species as functions of time.
- We shall program the reaction rate equations in the *equation window* of *Dymola*, making use of a *matrix-vector notation*, i.e., the chemical reaction network is described by the corresponding *N-matrix*.

- Although the reactions are occurring under *isothermic conditions*, we still wish to take the *Arrhenius' law* into account, and program the reaction rate constants as functions of temperature:

$$\begin{aligned}
 a k_1 &= 1.39 \cdot 10^8 \cdot \sqrt{T} \cdot \left( \frac{189243.0}{R \cdot T} \right)^{1.97} \\
 k_1 &= a k_1 \cdot \exp\left( \frac{-189243.0}{R \cdot T} \right) \\
 k_2 &= \frac{k_1}{K(T)} \\
 k_3 &= 10^{11.43} \cdot \exp\left( \frac{-82400.0}{R \cdot T} \right) \\
 k_5 &= 10^{11.97} \cdot \exp\left( \frac{-149800.0}{R \cdot T} \right) \\
 k_4 &= 0.1 \cdot k_5
 \end{aligned}$$

- where  $R$  is the gas constant ( $R = 8.314 \text{ J K}^{-1} \text{ mole}^{-1}$ ).

 Swiss Federal Institute of Technology Zürich

# Mathematical Modeling of Physical Systems

- Reaction  $k_2$  contains a temperature dependence  $K(T)$  that was experimentally found:

Abs. Temperature $T$ [K]	Equilibrium Const. $K$ [mole $m^{-3}$ ]
300.0	$7.7446 \times 10^{-29}$
400.0	$1.9543 \times 10^{-20}$
500.0	$2.2182 \times 10^{-15}$
600.0	$5.2844 \times 10^{-12}$
700.0	$1.3867 \times 10^{-9}$
800.0	$9.0782 \times 10^{-8}$
900.0	$2.3768 \times 10^{-6}$
1000.0	$3.2509 \times 10^{-5}$
1100.0	$2.7861 \times 10^{-4}$
1200.0	$1.6788 \times 10^{-3}$
1300.0	$7.6913 \times 10^{-3}$
1400.0	$2.8510 \times 10^{-2}$
1500.0	$8.8716 \times 10^{-2}$
1600.0	$2.4044 \times 10^{-1}$
1700.0	$5.8344 \times 10^{-1}$
1800.0	1.7947
1900.0	2.6061
2000.0	4.9431

- Program  $K(T)$  using a table-lookup function.

# Mathematical Modeling of Physical Systems

- The initial molar masses of  $Br_2$  and  $H_2$  are both equal to  $0.0075$ . The total reaction volume is  $V = 0.001 m^3$ . The temperature is  $T = 800 K$ .
- Simulate the system during **5000 seconds**. You need to reduce the tolerance value for the **DASSL integration algorithm** to  $10^{-10}$ .
- Plot on one graph the molar masses of  $Br_2$ ,  $H_2$ , and  $HBr$  during the first **0.1 seconds**.
- Plot on a second graph the molar mass of  $H^+$  during the first **0.2 seconds**.
- Plot on a third graph the molar mass of  $Br^+$  during the first **0.3 seconds**.

# Mathematical Modeling of Physical Systems

**We use a function.**

The **colon** here means that the array will adjust its dimension upon invocation.

**Protected variables** are hidden from the outside. They are strictly local.

The **algorithm** instruction allows users to encode sequential code. While equations are declarative, algorithms are procedural.

**Assert** is a clean way to ensure proper usage of the function. If the **assert** clause is not met, the simulation dies with the indicated error message.

## Mathematical Modeling of Physical Systems

- We can now create the model for the *hydrogen-bromine reaction*.

The problem is modeled entirely in the equation window. The code is a bit long. The declarations and equations shall be explained separately.

## Mathematical Modeling of Physical Systems

This is an abbreviation. Whenever I write "Math," I mean "Modelica.Math."

For convenience, I use the Matlab notation here.

Array sizes can be parameter expressions.

The Modelica notation is used here to declare this two-dimensional array. The Matlab notation would have worked equally well.

Initial conditions for the state vector.

Mathematical Modeling of Physical Systems

## Oxy-hydrogen Gas Reaction

- When oxygen and hydrogen gases are mixed in similar proportions, a spark can bring the mixture to explosion. The process can be described by the following set of step reactions:

$$\begin{aligned}
 \text{H}_2 + \text{O}_2 &\xrightarrow{k_0} \text{H}^\bullet + \text{HO}_2^\bullet \\
 \text{H}_2 + \text{OH}^\bullet &\xrightarrow{k_1} \text{H}^\bullet + \text{H}_2\text{O} \\
 \text{O}_2 + \text{H}^\bullet &\xrightarrow{k_2} \text{OH}^\bullet + \text{O}^\bullet \\
 \text{H}_2 + \text{O}^\bullet &\xrightarrow{k_3} \text{H}^\bullet + \text{OH}^\bullet \\
 \text{OH}^\bullet + \text{W} &\xrightarrow{k_4} \\
 \text{H}^\bullet + \text{W} &\xrightarrow{k_5} \\
 \text{O}^\bullet + \text{W} &\xrightarrow{k_6}
 \end{aligned}$$

W stands for the wall. At the wall, the unstable atoms  $\text{H}^\bullet$  and  $\text{O}^\bullet$ , as well as the unstable radical  $\text{OH}^\bullet$  can be absorbed. The absorption rates are proportional to the molar masses of the absorbed species:

$$v_{\text{OH}^\bullet} = -a_1 \cdot n_{\text{OH}^\bullet}$$

December 13, 2012 © Prof. Dr. François E. Cellier Start Presentation

**ETH**  
Eidgenössische Technische Hochschule Zürich

**Mathematical Modeling of Physical Systems**

- The reaction rate constants at the given temperature are as follows:
 

$k_0 = 60.0$   
 $k_1 = 2.3 \cdot 10^{11}$   
 $k_2 = 4.02 \cdot 10^9$   
 $k_3 = 2.82 \cdot 10^{12}$   
 $a_1 = 920.0$   
 $a_2 = 80.0$   
 $a_3 = 920.0$

Model the system in the *Dymola equation window* using a matrix-vector notation.

Simulate the system during 0.1 seconds. The initial conditions are  $n_{H_2} = 10^{-7}$ , and  $n_{O_2} = 0.5 \cdot 10^{-7}$ . The reaction volume is  $V = 1.0 \text{ m}^3$ .

You need to reduce the tolerance value of the *DASSL integration algorithm* to  $10^{-17}$ .

- Plot the molar masses of  $H_2$ ,  $O_2$ , and  $H_2O$  on one plot. Plot the molar masses of the other four species on separate plots.

**Mathematical Modeling of Physical Systems**

- Let us find the *N-matrix*:

$H_2 + O_2 \xrightarrow{k_0} H^* + HO_2^*$   
 $H_2 + OH^* \xrightarrow{k_1} H^* + H_2O$   
 $O_2 + H^* \xrightarrow{k_2} OH^* + O^*$   
 $H_2 + O^* \xrightarrow{k_3} H^* + OH^*$   
 $OH^* + W \xrightarrow{a_1}$   
 $H^* + W \xrightarrow{a_2}$   
 $O^* + W \xrightarrow{a_3}$

$N =$ 

	$k_0$	$k_1$	$k_2$	$k_3$	$a_1$	$a_2$	$a_3$
$H_2$	-1	-1	0	-1	0	0	0
$O_2$	-1	0	-1	0	0	0	0
$H_2O$	0	1	0	0	0	0	0
$H^*$	1	1	-1	1	0	-1	0
$O^*$	0	0	1	-1	0	0	-1
$OH^*$	0	-1	1	1	-1	0	0
$HO_2^*$	1	0	0	0	0	0	0

$H_2$   
 $O_2$   
 $H_2O$   
 $H^*$   
 $O^*$   
 $OH^*$   
 $HO_2^*$
