Homework 3 - Solution

LRK Order Increase by Blending

[H3.4] RK Order Increase by Blending

Given two separate n^{th} -order accurate RK algorithms in at least (n + 1) stages:

$$\begin{array}{lll} f_1(q) & = & 1+q+\frac{q^2}{2!}+\dots+\frac{q^n}{n!}+c_1\cdot q^{n+1} \\ f_2(q) & = & 1+q+\frac{q^2}{2!}+\dots+\frac{q^n}{n!}+c_2\cdot q^{n+1} \end{array}$$

where $c_2 \neq c_1$.

Show that it is always possible to use blending:

$$\mathsf{x}^{\mathsf{blended}} = \vartheta \cdot \mathsf{x}^1 + (1 - \vartheta) \cdot \mathsf{x}^2$$

where x^1 is the solution found using method $f_1(q)$ and x^2 is the solution found using method $f_2(q)$, such that x^{blended} is of order (n + 1).

Find a formula for ϑ that will make the blended algorithm accurate to the order (n + 1).

Homework 3 - Solution

LRK Order Increase by Blending

[H3.4] RK Order Increase by Blending II

$$\begin{split} f_{blended}(q) &= 1 + q + \frac{q^2}{2!} + \dots + \frac{q^n}{n!} + (\vartheta \cdot c_1 + (1 - \vartheta) \cdot c_2) \cdot q^{n+1} \\ &\stackrel{!}{=} 1 + q + \frac{q^2}{2!} + \dots + \frac{q^n}{n!} + \frac{q^{n+1}}{(n+1)!} \end{split}$$

has a solution for $c_2 \neq c_1$.

Homework 3 - Solution

-Runge-Kutta Integration

[H3.6] Runge-Kutta Integration

Given the following linear time-invariant continuous-time system:

$$\dot{\mathbf{x}} = \begin{pmatrix} 1250 & -25113 & -60050 & -42647 & -23999 \\ 500 & -10068 & -24057 & -17092 & -9613 \\ 250 & -5060 & -12079 & -8586 & -4826 \\ -750 & 15101 & 36086 & 25637 & 14420 \\ 250 & -4963 & -11896 & -8438 & -4756 \end{pmatrix} \cdot \mathbf{x} + \begin{pmatrix} 5 \\ 2 \\ 1 \\ -3 \\ 1 \end{pmatrix} \cdot \mathbf{u}$$
$$\mathbf{y} = (-1 \ 26 \ 59 \ 43 \ 23) \cdot \mathbf{x}$$

with initial conditions:

$$\mathbf{x_0} = \begin{pmatrix} 1\\ -2\\ 3\\ -4\\ 5 \end{pmatrix}$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ → 三 → のへぐ

Homework 3 - Solution

-Runge-Kutta Integration

[H3.6] Runge-Kutta Integration II

Simulate the system across 10 seconds of simulated time with step input using the RK4 algorithm with the α -vector and β -matrix:

$$\alpha = \begin{pmatrix} 1/2\\ 1/2\\ 1\\ 1 \end{pmatrix}; \quad \beta = \begin{pmatrix} 1/2 & 0 & 0 & 0\\ 0 & 1/2 & 0 & 0\\ 0 & 0 & 1 & 0\\ 1/6 & 1/3 & 1/3 & 1/6 \end{pmatrix}$$

The following fixed step sizes should be tried:

- 1. h = 0.32,
- 2. *h* = 0.032,
- 3. h = 0.0032.

Plot the three trajectories on top of each other. What can you conclude about the accuracy of the results?

Homework 3 - Solution

-Runge-Kutta Integration

[H3.6] Runge-Kutta Integration III

Figure: RK4 simulation with different step sizes

Homework 3 - Solution

-Runge-Kutta Integration

[H3.6] Runge-Kutta Integration IV

Defining the error as the infinity norm of the difference between the "correct" solution (computed using the lsim function) and the solution obtained using RK4, we find:

- 1. err(h = 0.32) = 44.9013,
- 2. err(h = 0.032) = 0.0012,
- 3. err(h = 0.0032) = 1.1801e 006.

Clearly, h = 0.32 leads to an unacceptably large error (the difference between the two curves is clearly visible by naked eye), whereas the other two step sizes may be acceptable for most engineering problems.

Homework 3 - Solution

BI4/50.45 Integration

[H3.12] BI4/ $5_{0.45}$ Integration for Linear Systems

Given the following linear time-invariant continuous-time system:

$$\dot{\mathbf{x}} = \begin{pmatrix} 1250 & -25113 & -60050 & -42647 & -23999 \\ 500 & -10068 & -24057 & -17092 & -9613 \\ 250 & -5060 & -12079 & -8586 & -4826 \\ -750 & 15101 & 36086 & 25637 & 14420 \\ 250 & -4963 & -11896 & -8438 & -4756 \end{pmatrix} \cdot \mathbf{x} + \begin{pmatrix} 5 \\ 2 \\ 1 \\ -3 \\ 1 \end{pmatrix} \cdot \mathbf{u}$$
$$\mathbf{y} = (-1 \ 26 \ 59 \ 43 \ 23) \cdot \mathbf{x}$$

with initial conditions:

$$\mathbf{x_0} = \begin{pmatrix} 1\\ -2\\ 3\\ -4\\ 5 \end{pmatrix}$$

Homework 3 - Solution

BI4/50.45 Integration

[H3.12] BI4/5 $_{0.45}$ Integration for Linear Systems II

Simulate the system across 10 seconds of simulated time with step input using $BI4/5_{0.45}$. The explicit semi-step uses the fourth-order approximation of RKF4/5. There is no need to compute the fifth-order corrector. The implicit semi-step uses the fifth-order corrector. There is no need to compute the fourth–order corrector. Since the system to be simulated is linear, the implicit semi-step can be implemented using matrix inversion. No step-size control is attempted.

We can apply the same technique to Runge-Kutta-Fehlberg:

 $[F4, G4, F5, G5] = rkf45_lin(A, B, h);$

└─Homework 3 - Solution └─BI4/5_{0.45} Integration

[H3.12] BI4/5_{0.45} Integration for Linear Systems V

We can now implement the linear $BI4/5_{0.45}$ algorithm. The forward semi-step is:

$$\mathbf{x}_{\mathbf{k}+\frac{1}{2}} = \mathbf{F}_4 \cdot \mathbf{x}_{\mathbf{k}} + \mathbf{G}_4 \cdot \mathbf{u}_{\mathbf{k}}$$

and the backward semi-step can be written as:

$$\mathbf{x}_{k+\frac{1}{2}} = \mathbf{F}_5 \cdot \mathbf{x}_{k+1} + \mathbf{G}_5 \cdot \mathbf{u}_{k+1}$$

and since we assume $\mathbf{u}_{\mathbf{k}+1} = \mathbf{u}_{\mathbf{k}}$:

$$x_{k+1} = F_5^{-1} \cdot x_{k+\frac{1}{2}} - F_5^{-1} \cdot G_5 \cdot u_k$$

Therefore:

$$\mathbf{x_{k+1}} = \mathbf{F_5}^{-1} \cdot \mathbf{F_4} \cdot \mathbf{x_k} + \mathbf{F_5}^{-1} \cdot (\mathbf{G_4} - \mathbf{G_5}) \cdot \mathbf{u_k} = \mathbf{F_{BI}} \cdot \mathbf{x_k} + \mathbf{G_{BI}} \cdot \mathbf{u_k}$$

◆ロ > ◆母 > ◆臣 > ◆臣 > ─ 臣 ─ のへで

Homework 3 - Solution

BI4/50.45 Integration

[H3.12] BI4/ $5_{0.45}$ Integration for Linear Systems VIII

Defining the error as the infinity norm of the difference between the "correct" solution (computed using the lsim function) and the solution obtained using the linear version of $BI4/5_{0.45}$, we find:

- 1. err(h = 0.32) = 0.0912,
- 2. err(h = 0.032) = 3.4369e 006,
- 3. err(h = 0.0032) = 2.0777e 006.

The solution with h = 0.32 leads to an error that is a bit on the large side but still quite reasonable, whereas the solution with h = 0.032 is perfect. Using h = 0.0032, we don't gain much. The roundoff (shift-out) error kills the additional accuracy that we might gain when using a larger mantissa.

Homework 3 - Solution

BI4/50.45 Integration

[H3.14] BI4/ $5_{0.45}$ Integration for Non-linear Systems

Repeat Hw.[H3.12]. This time, we want to replace the matrix inversion by Newton iteration. Of course, since the problem is linear and time-invariant, Newton iteration and modified Newton iteration are identical. Iterate until $\delta_{\rm rel} \leq 10^{-5}$, where:

$$\delta_{\mathrm{rel}} = \frac{\|\mathbf{x}_{\mathbf{k}+\frac{1}{2}}^{\mathrm{right}} - \mathbf{x}_{\mathbf{k}+\frac{1}{2}}^{\mathrm{left}}\|_{\infty}}{\max(\|\mathbf{x}_{\mathbf{k}+\frac{1}{2}}^{\mathrm{left}}\|_{2}, \|\mathbf{x}_{\mathbf{k}+\frac{1}{2}}^{\mathrm{right}}\|_{2}, \delta)}$$

A D M 4 目 M 4 日 M 4 1 H 4

Compare the results obtained with those found in Hw.[H3.12].

Figure: BI4/50.45 non-linear simulation with different step sizes

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへ⊙

Homework 3 - Solution

BI4/50.45 Integration

[H3.14] BI4/5 $_{0.45}$ Integration for Non-linear Systems IV

Defining the error as the infinity norm of the difference between the "correct" solution (computed using the lsim function) and the solution obtained using the non-linear version of $BI4/5_{0.45}$, we find:

- 1. err(h = 0.32) = 0.0912,
- 2. err(h = 0.032) = 3.4248e 006,
- 3. err(h = 0.0032) = 1.2194e 006.

The results are almost identical as for the linear solution. This is not surprising, because for a linear system, Newton iteration converges to the correct solution within a single iteration step.

Homework 3 - Solution

BI4/50.45 Integration

[H3.14] BI4/5 $_{0.45}$ Integration for Non-linear Systems V

Building a special linear version of the $BI4/5_{0.45}$ code wasn't worth it, and is hardly ever done. In fact, we were lucky, because, by simulating a step response, the ZOH applied to the input had no influence on the solution. In general, the non-linear solution will be better, because it makes use of the correct values of the inputs throughout the step.

Homework 3 - Solution

BI4/50.45 Integration

[H3.14] BI4/5 $_{0.45}$ Integration for Non-linear Systems V

Building a special linear version of the $BI4/5_{0.45}$ code wasn't worth it, and is hardly ever done. In fact, we were lucky, because, by simulating a step response, the ZOH applied to the input had no influence on the solution. In general, the non-linear solution will be better, because it makes use of the correct values of the inputs throughout the step.

The only situation, where we might want to use the linear version is in a *real-time context*. The linear $BI4/5_{0.45}$ code computes almost everything off-line, i.e., before the simulation starts. The simulation loop is reduced to two multiplications and an addition. The non-linear $BI4/5_{0.45}$ code needs to call bi45t_step, which in return calls rkf45_step twice, during each simulation step.
