If your tables tend to look like the above you may find this guide helpful

## Background

- Up to 2005, I had been writing technical publications for 8 years, creating roughly 35 fully reviewed papers, 2 theses, 20 proposals, and many other pages of technical writing
- In each case I spent a lot of effort on content and visual presentation; I am really picky
- In 2005 I learned (from Goran Frehse, thank you!) that I had had no clue how to make tables
- I summarize what I have learned in this short guide

#### Resources

"Chicago Manual of Style," The University of Chicago Press

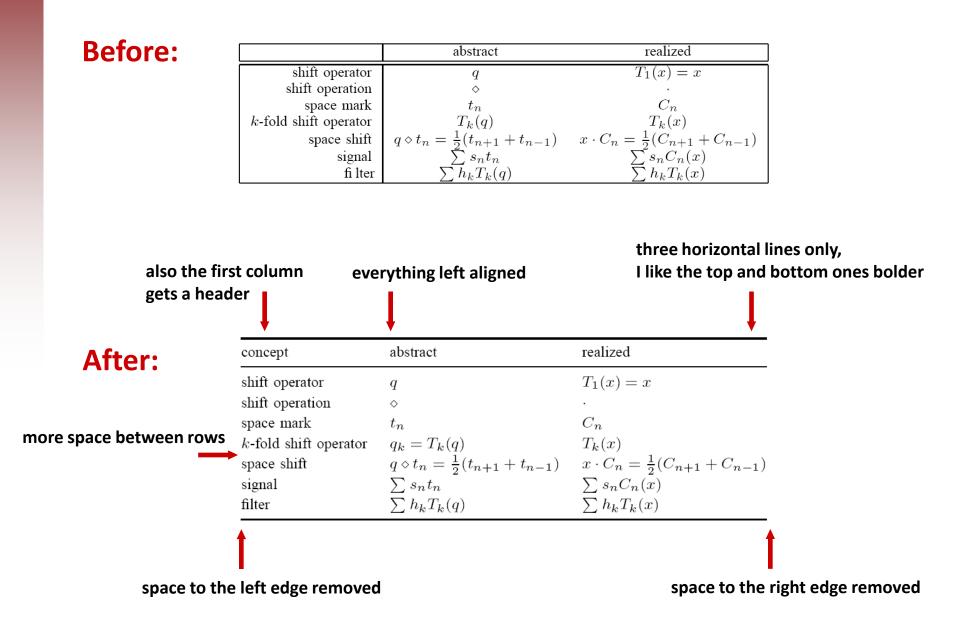

Latex users: Use booktabs.sty and its documentation <u>http://texcatalogue.sarovar.org/entries/booktabs.html</u>

#### **Most Important Guidelines for Making Tables**

Avoid vertical lines

- Avoid "boxing up" cells, usually 3 horizontal lines are enough: above, below, and after heading (see examples in this guide)
- Avoid double horizontal lines
- Enough space between rows
- If in doubt, align left

### **Example: Before and After**

#### **In Latex**

Style: \usepackage {booktabs }

Horizontal lines: read documentation of booktabs <u>http://texcatalogue.sarovar.org/entries/booktabs.html</u>

- More space between rows: \renewcommand{\arraystretch}{1.2} (or 1.3)
- Remove space to the vertical edges: \begin{tabular}{@{}lll@{}} ...

## **Hierarchical Tables: Examples**

# One level of hierarchy: x-axis only

## **Further Examples**

The following tables are taken from the magazine Economist

#### They demonstrate

- How to handle multiple levels of hierarchy
- Alignment, handling of long headers
- The use of light gray to further divide the tables
- Horizontal lines provide readability under denser packing and when lots of numbers are organized
- Sans serif fonts are preferrable for readability; of course, if you need math symbols and use latex, then stick with roman
- Title above table, sometimes with unit of measure
- The use of footnotes
- Different types of horizontal lines

   (I personally don't like the use of more than two)
