Executive Summary

Problem: Processing-Using-DRAM (PUD) suffers from three issues caused by DRAM's large and rigid access granularity

- Underutilization due to data parallelism variation in (and across) applications
- Limited computation support due to a lack of interconnects
- Challenging programming model due to a lack of compilers

Goal: Design a flexible PUD system that overcomes the three limitations caused by DRAM's large and rigid access granularity

Key Mechanism: MIMDRAM, a hardware/software co-design PUD system

- **Key idea:** leverage fine-grained DRAM for PUD operation
- **HW:** - simple changes to the DRAM array, enabling concurrent PUD operations
- low-cost interconnects at the DRAM peripherals for data reduction
- **SW:** - compiler and OS support to generate and map PUD instructions

Key Results: MIMDRAM achieves

- **14.3x, 30.6x, and 6.8x** the energy efficiency of state-of-the-art PUD systems, a high-end CPU and GPU, respectively
- Small area cost to a DRAM chip (**1.11%**) and CPU die (**0.6%**)

Processing-using-DRAM (PuD) is an emerging paradigm that leverages the analog operational properties of DRAM circuitry to enable massively parallel in-DRAM computation. PuD has the potential to significantly reduce or eliminate costly data movement between processing elements and main memory. A common approach for PuD architectures is to make use of bulk bitwise computation (e.g., AND, OR, NOT). Prior works experimentally demonstrate three-input MAJ (i.e., MAJ3) and two-input AND and OR operations in commercial off-the-shelf (COTS) DRAM chips. Yet, demonstrations on COTS DRAM chips do not provide a functionally complete set of operations (e.g., NAND or AND and NOT).

systems and applications [12, 13]. Processing-using-DRAM (PuD) [29–32] is a promising paradigm that can alleviate the data movement bottleneck. PuD uses the analog operational properties of the DRAM circuitry to enable massively parallel in-DRAM computation. Many prior works [29–53] demonstrate that PuD can greatly reduce or eliminate data movement.

A widely used approach for PuD is to perform bulk bitwise operations, i.e., bitwise operations on large bit vectors. To perform bulk bitwise operations using DRAM, prior works propose modifications to the DRAM circuitry [29–31, 33, 35, 36, 43, 44, 46, 48–58]. Recent works [38, 41, 42, 45] experimentally demonstrate the feasibility of executing data copy & initializa-

Outline

1 Introduction & Background

2 Limitations of PUD Systems

3 MIMDRAM

4 Hardware Overview

5 Software Support

6 Evaluation

7 Conclusion

Limitations of PUD Systems: Overview

PUD systems suffer from **three sources of inefficiency** due to the **large** and **rigid** DRAM access granularity

1 SIMD Underutilization

- due to data parallelism variation within and across applications
- leads to throughput and energy waste

2 Limited Computation Support

- due to a lack of low-cost interconnects across columns
- limits PUD operations to only parallel map constructs

3 Challenging Programming Model

- due to a lack of compiler support for PUD systems
- creates a burden on programmers, limiting PUD adoption

Limitations of PUD Systems:

Overview

PUD systems suffer from **three sources of inefficiency** due to the **large** and **rigid** DRAM access granularity

1 SIMD Underutilization

- due to data parallelism variation within and across applications
- leads to throughput and energy waste

2 Limited Computation Support

- due to a lack of low-cost interconnects across columns
- limits PUD operations to only parallel map constructs

3 Challenging Programming Model

- due to a lack of compiler support for PUD systems
- creates a burden on programmers, limiting PUD adoption

Limitations of PUD Systems: Underutilization of SIMD Lanes (I)

Application Analysis:

quantify the fraction of **SIMD parallelism** in real applications

Maximum Vectorization Factor:

maximum number of scalar operands that fit into a SIMD register

Ideal maximum vectorization factor = # DRAM columns (e.g., 65,536)

Limitations of PUD Systems:

Underutilization of SIMD Lanes (II)

Application Analysis:
quantify the fraction of SIMD parallelism in real applications

Limitations of PUD Systems:

Underutilization of SIMD Lanes (II)

Application Analysis:

quantify the fraction of **SIMD parallelism** in real applications

Takeaway

**SIMD parallelism significantly varies
within a single application and
across different applications**

Limitations of PUD Systems: Underutilization of SIMD Lanes (III)

Application Analysis:

quantify the fraction of **SIMD parallelism** in real applications

Takeaway

A small fraction of vectorized loops have
a large enough maximum vectorization factor to
fully exploit the SIMD parallelism of PUD systems

Limitations of PUD Systems: Overview

PUD systems suffer from **three sources of inefficiency** due to the **large** and **rigid** DRAM access granularity

1

SIMD Underutilization

- due to data parallelism variation within and across applications
- leads to throughput and energy waste

2

Limited Computation Support

- due to a lack of low-cost interconnects across columns
- limits PUD operations to only parallel map constructs

3

Challenging Programming Model

- due to a lack of compiler support for PUD systems
- creates a burden on programmers, limiting PUD adoption

Limitations of PUD Systems:

Limited Computation Support

PUD systems do not support vector reduction at low area cost since **data movement is bounded to within a DRAM column**

Takeaway

Directly connecting all DRAM columns using a custom all-to-all interconnect leads to large (i.e., 21%) area cost

Limitations of PUD Systems: Overview

PUD systems suffer from **three sources of inefficiency** due to the **large** and **rigid** DRAM access granularity

1

SIMD Underutilization

- due to data parallelism variation within and across applications
- leads to throughput and energy waste

2

Limited Computation Support

- due to a lack of low-cost interconnects across columns
- limits PUD operations to only parallel map constructs

3

Challenging Programming Model

- due to a lack of compiler support for PUD systems
- creates a burden on programmers, limiting PUD adoption

Limitations of PUD Systems: Challenging Programming Model

Programmer's Tasks:

Goal:

Just write
my kernel

High-level code for

$C[i] = (A[i] > \text{pred}[i]) ? A[i] + B[i] : A[i] - B[i]$

```
for (int i = 0; i < size ; ++ i){  
    bool cond = A[i] > pred[i];  
    if (cond) C[i] = A[i] + B[i];  
    else C[i] = A[i] - B[i];  
}
```

Limitations of PUD Systems: Challenging Programming Model

Programmer's Tasks:

Map & align
data structures

Goal:

Just write
my kernel

High-level code for

$C[i] = (A[i] > \text{pred}[i]) ? A[i] + B[i] : A[i] - B[i]$

```
for (int i = 0; i < size ; ++ i){  
    bool cond = A[i] > pred[i];  
    if (cond) C[i] = A[i] + B[i];  
    else C[i] = A[i] - B[i];  
}
```

Limitations of PUD Systems: Challenging Programming Model

Programmer's Tasks:

Map & align
data structures

Identify
array boundaries

Goal:

Just write
my kernel

High-level code for

$C[i] = (A[i] > \text{pred}[i]) ? A[i] + B[i] : A[i] - B[i]$

```
for (int i = 0; i < size ; ++ i){  
    bool cond = A[i] > pred[i];  
    if (cond) C[i] = A[i] + B[i];  
    else  C[i] = A[i] - B[i];  
}
```

Limitations of PUD Systems: Challenging Programming Model

Programmer's Tasks:

Goal:

Map & align
data structures

Identify
array boundaries

Manually
unroll loop

Map C to
PUD instructions

Just write
my kernel

High-level code for

$C[i] = (A[i] > \text{pred}[i]) ? A[i] + B[i] : A[i] - B[i]$

```
for (int i = 0; i < size ; ++ i){  
    bool cond = A[i] > pred[i];  
    if (cond) C[i] = A[i] + B[i];  
    else  C[i] = A[i] - B[i];  
}
```

Limitations of PUD Systems: Challenging Programming Model

Programmer's Tasks:

Goal:

Map & align
data structures

Identify
array boundaries

Manually
unroll loop

Map C to
PUD instructions

Orchestrate
data movement

Just write
my kernel

High-level code for

$C[i] = (A[i] > \text{pred}[i]) ? A[i] + B[i] : A[i] - B[i]$

```
for (int i = 0; i < size ; ++ i){  
    bool cond = A[i] > pred[i];  
    if (cond) C[i] = A[i] + B[i];  
    else  C[i] = A[i] - B[i];  
}
```

Limitations of PUD Systems: Challenging Programming Model

Programmer's Tasks:

Goal:

Map & align
data structures

Identify
array boundaries

Manually
unroll loop

Map C to
PUD instructions

Orchestrate
data movement

Just write
my kernel

PUD's assembly-like code for

$C[i] = (A[i] > \text{pred}[i]) ? A[i] + B[i] : A[i] - B[i]$

```
bbop_trsp_init(A , size , elm_size);
bbop_trsp_init(B , size , elm_size);
bbop_trsp_init(C , size , elm_size);

bbop_add(D , A , B , size , elm_size);
bbop_sub(E , A , B , size , elm_size);
bbop_greater(F , A , pred , size , elm_size);
bbop_if_else(C , D , E , F , size , elm_size);
```

Problem & Goal

Problem

Processing-Using-DRAM's large and rigid granularity limits its applicability and efficiency for different applications

Goal

Design a flexible PUD system that overcomes the three limitations caused by large and rigid DRAM access granularity

Outline

1 Introduction & Background

5 Software Support

6 Evaluation

7 Conclusion

MIMDRAM:

Key Idea (I)

DRAM's hierarchical organization can enable fine-grained access

Key Issue:

on a DRAM access, the global wordline propagates across all DRAM mats

Fine-Grained DRAM:

segments the global wordline to access **individual** DRAM mats

MIMDRAM: Key Idea (II)

Fine-Grained DRAM:

segments the global wordline to access **individual** DRAM mats

Fine-grained DRAM for energy-efficient DRAM access:

[Cooper-Balis+, 2010]: Fine-Grained Activation for Power Reduction in DRAM

[Udipi+, 2010]: Rethinking DRAM Design and Organization for Energy-Constrained Multi-Cores

[Zhang+, 2014]: Half-DRAM

[Ha+, 2016]: Improving Energy Efficiency of DRAM by Exploiting Half Page Row Access

[O'Connor+, 2017]: Fine-Grained DRAM

[Olgun+, 2024]: Sector DRAM

MIMDRAM: Key Idea (III)

Fine-grained DRAM for processing-using-DRAM:

1 Improves SIMD utilization

- for a single PUD operation, only access the DRAM mats with target data

MIMDRAM:

Key Idea (III)

Fine-grained DRAM for processing-using-DRAM:

1 Improves SIMD utilization

- for a single PUD operation, only access the DRAM mats with target data
 - for multiple PUD operations, execute independent operations concurrently
- **multiple instruction, multiple data (MIMD) execution model**

MIMDRAM: Key Idea (III)

Fine-grained DRAM for processing-using-DRAM:

1 Improves SIMD utilization

- for a single PUD operation, only access the DRAM mats with target data
- for multiple PUD operations, execute independent operations concurrently
→ multiple instruction, multiple data (MIMD) execution model

2 Enables low-cost interconnects for vector reduction

- global and local data buses can be used for inter-/intra-mat communication

MIMDRAM: Key Idea (III)

Fine-grained DRAM for processing-using-DRAM:

1 Improves SIMD utilization

- for a single PUD operation, only access the DRAM mats with target data
- for multiple PUD operations, execute independent operations concurrently
→ multiple instruction, multiple data (MIMD) execution model

2 Enables low-cost interconnects for vector reduction

- global and local data buses can be used for inter-/intra-mat communication

3 Eases programmability

- SIMD parallelism in a DRAM mat is on par with vector ISAs' SIMD width

MIMDRAM: Overview

MIMDRAM is a hardware/software co-designed PUD system that enables **fine-grained PUD computation** at **low cost** and **programming effort**

Main components of MIMDRAM:

1 Hardware

- DRAM array modification **to enable fine-grained PUD computation**
- inter- and intra-mat interconnects **to enable PUD vector reduction**
- control unit design **to orchestrate PUD execution**

2 Software

- compiler support **to transparently generate PUD instructions**
- system support **to map and execute PUD instructions**

```

Goal

Identify SIMD parallelism, generate PUD instructions, and set the appropriate vectorization factor

Goal

Improve SIMD utilization by allowing the distribution of independent PUD instructions across DRAM mats

MIMDRAM: Compiler Support (III)

Goal Identify SIMD parallelism, generate PUD instructions, and set the appropriate vectorization factor

Goal Improve SIMD utilization by allowing the distribution of independent PUD instructions across DRAM mats

Goal Generate the appropriate binary for data allocation and PUD instructions

MIMDRAM:

Overview

MIMDRAM is a hardware/software co-designed PUD system that enables **fine-grained PUD computation** at **low cost** and **programming effort**

Main components of MIMDRAM:

1 Hardware-side

- DRAM array modification to enable fine-grained PUD computation
- inter- and intra-mat interconnects to enable PUD vector reduction
- control unit design to orchestrate PUD execution

2 Software

- new compiler support to transparently generate PUD instructions
- **system support to map and execute PUD instructions**

MIMDRAM: System Support

- Instruction set architecture
- Execution & data transposition
- Data coherence
- Address translation
- Data allocation & alignment
- Mat label translation

MIMDRAM: System Support

- Instruction set architecture
- Execution & data transposition
- Data coherence
- Address translation
- **Data allocation & alignment**
- Mat label translation

MIMDRAM:

Data Allocation & Alignment

MIMDRAM's memory allocator uses
a pool of **huge pages** and **reversed-engineered DRAM** interleaving
information for PUD memory objects

6 Evaluation

7 Conclusion

Evaluation:

Methodology Overview

- **Evaluation Setup**

- **CPU:** Intel Skylake CPU
- **GPU:** NVIDIA A100 GPU
- **PUD:** SIMDram [Oliveira+, 2021] and DRISA [Li+, 2017]
- **PND:** Fulcrum [Lenjani+, 2020]
- <https://github.com/CMU-SAFARI/MIMDRAM>

- **Workloads:**

- 12 workloads from Polybench, Rodinia, Phoenix, and SPEC2017
- 495 multi-programmed application mixes

- **Two-Level Analysis**

- **Single application** → leverages intra-application data parallelism
- **Multi-programmed workload** → leverages inter-application data parallelism

Evaluation:

Single Application Analysis – Energy Efficiency

Takeaway

MIMDRAM significantly improves energy efficiency compared to CPU (30.6x), GPU (6.8x), and SIMD (14.3x)

Evaluation:

Multi-Programmed Workload Analysis

Takeaway

**MIMDRAM significantly improves
system throughput (1.68x)
compared to SIMDRAM**

Evaluation:

Comparison to Other PIM Architectures

Takeaway

MIMDRAM significantly improves performance/area compared to DRISA (1.18x) and Fulcrum (1.92x)

Evaluation:

More in the Paper

- **MIMDRAM with subarray and bank-level parallelism**
 - MIMDRAM provides significant performance gains compared to the baseline CPU (**13.2x**) and GPU (**2x**)
- **Comparison to DRISA and Fulcrum for multi-programmed workloads**
 - MIMDRAM achieves system throughput on par with DRISA and Fulcrum
- **MIMDRAM's SIMD utilization versus SIMD RAM**
 - MIMDRAM provides **15.6x** the utilization of SIMD RAM
- **Area analysis**
 - MIMDRAM adds small area cost to a DRAM chip (**1.11%**) and CPU die (**0.6%**)

Evaluation:

More in the Paper

- MIMDRAM with subarray and bank-level parallelism

- MIMDRAM provides significant performance gains compared to the baseline CPU (12.2x) and GPU (2.2x)

Conclusion

We introduced MIMDRAM,
a hardware/software co-designed processing-using-DRAM system

- **Key idea:** leverage fine-grained DRAM for processing-using-DRAM operation
- **HW:** - simple changes to DRAM, enabling concurrent instruction execution
- low-cost interconnects at the DRAM peripherals for data reduction
- **SW:** - compiler and OS support to generate and map instructions

Our evaluation demonstrates that MIMDRAM

- **significantly** improves **performance**, **energy efficiency**, and **throughput** compared to processor-centric (CPU and GPU) and memory-centric (SIMDRAM, DRISA, and Fulcrum) architectures
- incurs **small area cost** to a DRAM chip and CPU die

Bit-Serial PUD Addition

Intra-Mat Interconnect

Performance for Single Applications

SIMD Utilization: MIMDRAM vs. SIMDRAM

Weighted Speedup vs. CPU

Multi-Applications: Full Data

Multi-Applications: DRISA & Fulcrum

BLP and SALP

System Configuration

Table 2: Evaluated system configurations.

Real Intel Skylake CPU [209]	x86 [199], 16 cores, 8-wide, out-of-order, 4 GHz; <i>L1 Data + Inst. Private Cache: 256 kB, 8-way, 64 B line;</i> <i>L2 Private Cache: 2 kB, 4-way, 64 B line;</i> <i>L3 Shared Cache: 16 MB, 16-way, 64 B line;</i> <i>Main Memory: 64 GB DDR4-2133, 4 channels, 4 ranks</i>
Real NVIDIA A100 GPU [210]	7 nm technology node; 6912 CUDA Cores; 108 streaming multiprocessors, 1.4 GHz base clock; <i>L2 Cache: 40 MB L2 Cache; Main Memory: 40 GB HBM2 [119, 120]</i>
Simulated SIMDRAM [101] & MIMDRAM	gem5 system emulation; x86 [199], 1-core, out-of-order, 4 GHz; <i>L1 Data + Inst. Cache: 32 kB, 8-way, 64 B line;</i> <i>L2 Cache: 256 kB, 4-way, 64 B line;</i> <i>Memory Controller: 8 kB row size, FR-FCFS [215, 216]</i> <i>Main Memory: DDR4-2400, 1 channel, 8 chips, 4 rank</i> <i>16 banks/rank, 16 mats/chip, 1 K rows/mat, 512 columns/mat</i> <i>MIMDRAM's Setup: 8 entries mat queue, 2 kB bbop buffer</i> <i>8 μProgram processing engines, 2 kB mat translation table</i>

Workload Characteristics

Table 3: Evaluated applications and their characteristics.

Benchmark Suite	Application (Short Name)	Dataset Size	# Vector Loops	VF {min, max}	PUD Ops. [†]
Phoenix [161]	[‡] pca (pca)	reference	2	{4000, 4000}	D, S, M, R
Polybench [162]	2mm (2mm)	NI = NJ = NK = NL = 4000	6	{4000, 4000}	M, R
	[‡] 3mm (3mm)	NI = NJ = NK = NL = NM = 4000	7	{4000, 4000}	M, R
	covariance (cov)	N = M = 4000	2	{4000, 4000}	D, S, R
	doitgen (dg)	NQ = NR = NP = 1000	5	{1000, 1000}	M, C, R
	[‡] fdtd-apml (fdtd)	CZ = CYM = CXM = 1000	3	{1000, 1000}	D, M, S, A
	gemm (gmm)	NI = NJ = NK = 4000	4	{4000, 4000}	M, R
