Data Overwhelms Modern Machines …

- Storage/memory capability
- Communication capability
- Computation capability
- Greatly impacts robustness, energy, performance, cost

An Intelligent Architecture Handles Data Well

Corollaries: Architectures Today …

- Architectures are terrible at dealing with data
  - Designed to mainly store and move data vs. to compute
  - They are processor-centric as opposed to **data-centric**
- Architectures are terrible at taking advantage of vast amounts of data (and metadata) available to them
  - Designed to make simple decisions, ignoring lots of data
  - They make human-driven decisions vs. **data-driven** decisions
- Architectures are terrible at knowing and exploiting different properties of application data
  - Designed to treat all data as the same
  - They make component-aware decisions vs. **data-aware**

Architectures for Intelligent Machines

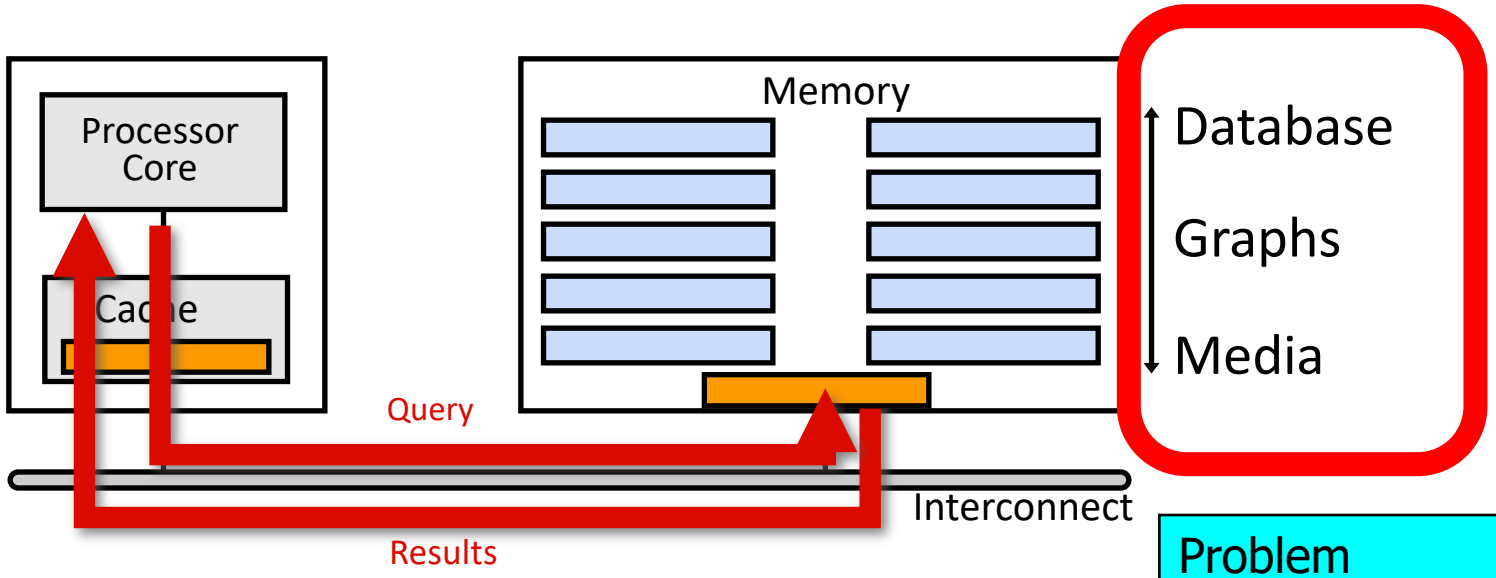
Data-driven

Data-aware

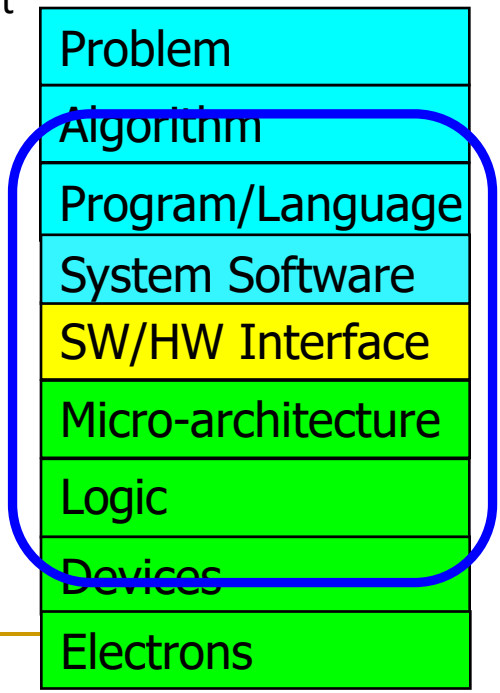
Data-Centric (Memory-Centric) Architectures

Processing Data Where It Makes Sense

Goal: Processing Inside Memory



- Many questions … How do we design the:
  - compute-capable memory & controllers?
  - processor chip and in-memory units?
  - software and hardware interfaces?
  - system software, compilers, languages?
  - algorithms and theoretical foundations?



Processing in Memory: Two Approaches

1. Minimally changing memory chips
2. Exploiting 3D-stacked memory
